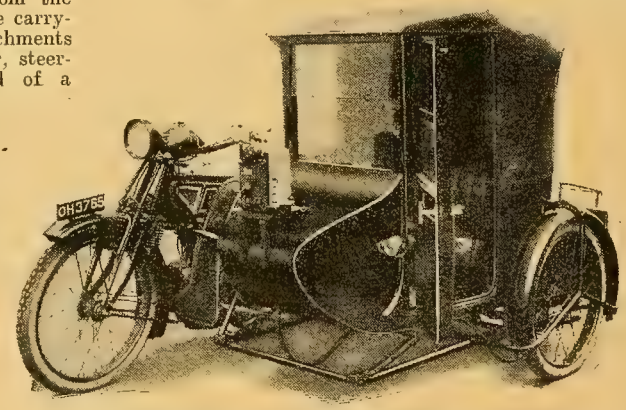
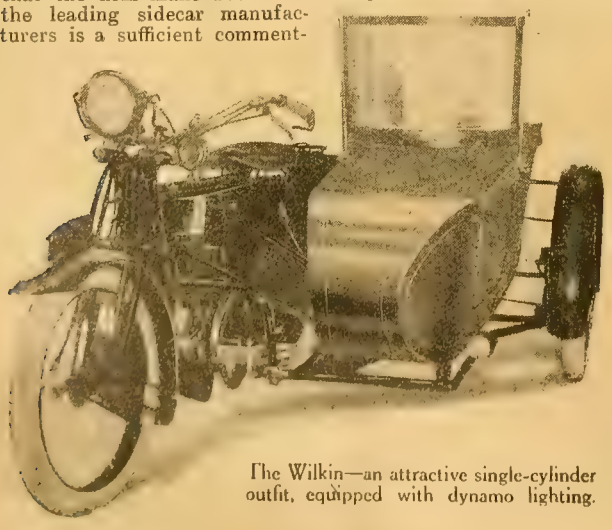
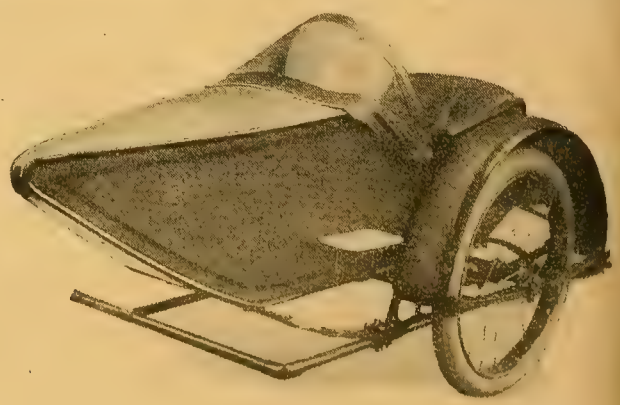
SANDHAM ENGINEERING CO., LTD., 336, Gray's Inn Road, W.C.1.—Although the Sandham Engineering Co. produce all their own chassis, luxurious bodywork is their speciality, and the models they are offering are specially commendable from this point of view. The fact also that the firm make bodies for many of the leading sidecar manufacturers is a sufficient commentary on their quality. Probably the most luxurious sidecar they manufacture is the full touring model, which is designed on very graceful lines. The chassis is underslung and the wheel is encircled by a tubular member, so that the axle is supported at both ends. This is a form of construction which the makers very strongly recommend to all sidecar users. The body is carried upon double-ended C springs, and is remarkable for its exceptionally fine upholstery. A hinged dash extends backwards over the door, and a large locker is provided behind the seat. On the top of this is a steel luggage grid. Other bodies which call for special attention are the Dual-purpose sidecar and the Sports model; the former is readily convertible from a single to a two-seater, this being done by moving the back rest of the seat forward and dropping the back of the body to some extent so as to give room for an additional adult passenger at the back. In order to provide sufficient leg room, there is a well in the centre of the body immediately behind the position of the front seats, and also a drop-down compartment in the floorboards at the front of the sidecar. Two normal adult passengers can be accommodated in this sidecar without difficulty. The second sidecar mentioned (the Sports model) is somewhat different from the class of machine usually so named, in so far that it provides much more comfortable seating capacity, while the back rest is brought up to a high position to support the shoulders of the passenger. Generally the lines of this body are very graceful, and it



One of the greatest attractions of the Olympia Show was the number of taxi sidecars exhibited. Here is a Watsonian with the taximeter mounted on the nose of the body.



The Wilkin—an attractive single-cylinder outfit, equipped with dynamo lighting.



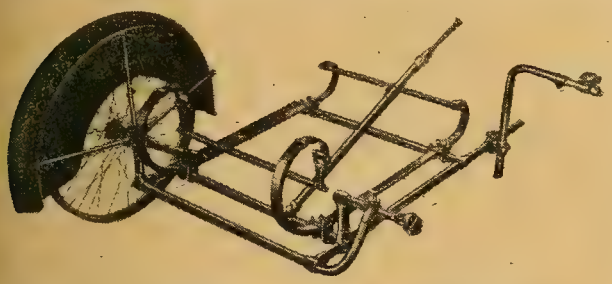
Sporting model sidecars are showing no sign of waning popularity, and the faults of the earlier models are being eliminated. Comfort is now provided, without sacrifice of speedy appearance, as exemplified in this particular Grindlay model

Sidecar Progress.—

tapers to a point at the rear. The portion behind the seat is utilised as a locker, which is covered by a hinged lid having a spring catch which prevents rattle. In addition to these standard models, there is also the Imperial, which has a fully sprung wheel. The bodywork of this is very similar to that already described on the touring model, but the wheel is carried between two half-elliptic springs, rigidly secured in front and attached to shackles at the rear. In order to preserve the wheel in a truly vertical plane when cornering, another shackle is provided between the side member of the chassis and a vertical fork which springs from the axle lugs.

SCOTT.

SCOTT MOTOR CYCLE CO., LTD., Shipley, Yorks.—No change has been made in the Scott sidecar chassis, which is essentially a continuation of the frame of the machine to which it is fitted, since the triangulation is not only complete in itself, but also in its relation to the cycle frame members. The bodywork and springing are also unchanged, but the springs are now made in the Scott works in order to ensure absolute uniformity of material and temper.



A Dunhill chassis offered as a substitute for the more expensive triangulated pattern.

SCOUT.

R. WEATHERELL, South Green, Billericay, Essex.—One of the R.W. Scout two-stroke lightweights (of 318 c.c.) is provided with a very nicely finished lightweight sidecar specially made for the firm. The body is finished in polished aluminium, and is placed on a chassis which is triangular in front, with a rectangular frame at the rear. As in the case of many of the lightweight outfits, a three-point attachment has been found amply sufficient, but special care has been taken to strengthen up the chain stay support. Since it is likely that a lightweight machine of this kind will often be used for solo riding, it is important that the sidecar should be made easily detachable, which has accordingly been done in this case. The body is deeper than is usual for this class of sidecar, and is very comfortable to sit in.

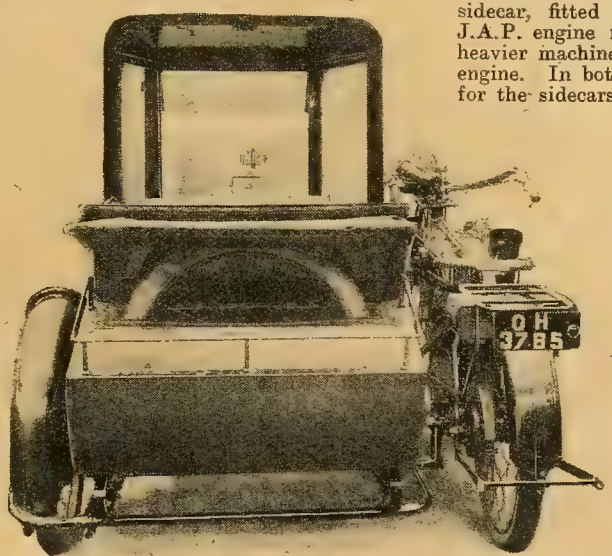
SUNBEAM.

JOHN MARSTON, LTD., Sunbeamland, Wolverhampton.—Sunbeam sidecars are chiefly remarkable for the particular excellence of the workmanship employed in their construction and for the durability of the materials, not only those used for the chassis, but also the upholstery. They are particularly firmly attached at the front end, having a double tube to the steering head as well as an attachment to a specially strengthened footrest. The wheel has a tube all round it, and runs on a spindle instead of a stub axle. In all the types of bodies offered, a particularly long and comfortable seat is fitted with a well squabbed back. In one case this back is extraordinarily deep, so that the whole body of the passenger is under protection: in another type the top of the sidecar is cut flush, giving a very sporting appearance but not quite so much protection.

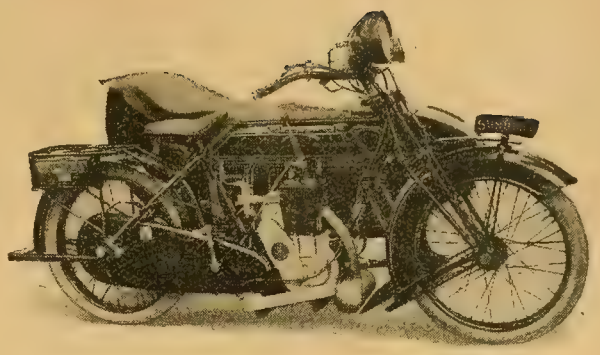
TRIUMPH.

TRIUMPH CYCLE CO., LTD., Coventry.—In the Gloria sidecar, as fitted to Triumph machines, an effort has been made to provide the comfort usually associated with heavyweight sidecars with the lightness necessary for use with a 4 h.p. machine. Perhaps the most noticeable point on first inspection is the way in which all the cross members of the frame are sunk three or four inches to allow for an extra deep, and, therefore, extra comfortable, body.

Incorporated in the connections from the chain stay to the chassis is a petrol tin carrier, which forms part of the construction, and a large luggage grid, separately sprung, is provided at the rear.

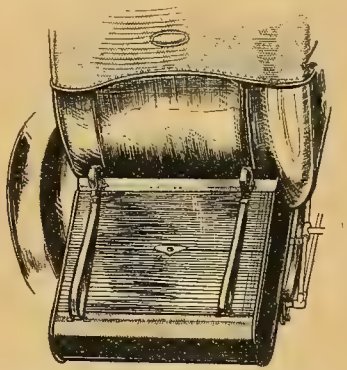


Partially concealed, the spare wheel on the Watsonian taxi-sidecar is carried immediately in front of the large locker.



Interchangeable wheels on 3½ h.p. sidecar outfits are a rarity. This smart Sunbeam is so equipped.

The sprung sidecar wheel is still provided, the stub axle being slung on a swinging bar, while shocks are absorbed by an enclosed coil spring immediately above the hub.



At the rear of the Campion sidecar taxi there is a large locker with an additional luggage platform on top.

VICTORIA.

VICTORIA MOTOR AND CYCLE CO., LTD., Victoria Works, Dennistoun, Glasgow.—On the Victoria stand were two types of sidecar, fitted respectively to a 4 h.p. J.A.P. engine machine and to a rather heavier machine with a Coventry Victor engine. In both cases the prices quoted for the sidecars were extremely low, the former type being £25 and the heavier £35. In each instance also the frame of the chassis takes the form of a large rectangle entirely surrounding the body, and in the heavier type the motor cycle side is made of girder construction to stand the additional load. A good point in both cases is that the bent tube going to the steering head has a cross tie on it. The bodywork is not extremely luxurious, but quite comfortable, and, taken as a whole, both the sidecars are excellent value. Their finish is very serviceable.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

PLEASURE IN POLISH.

Sir,—Having read the interesting "Open Letter to the Trade," by B. H. Davies, I have come to the conclusion that he, like many others, dislikes cleaning his machine. *Re* his remarks about the eighteen-year-old "dude," as he terms him, I happen to be nineteen, and, as far as my machine goes, I suppose I am a "dude." I find no greater pleasure than keeping my machine spotlessly clean, the same as my father did with all his own. It may be strange, but I feel positively uncomfortable when out and my machine has become dirty. I feel sure that there are many others who will agree with me when I say that a bicycle worth having is worth keeping clean. Let the manufacturers put on as much plating as they like. I may also add that I am an all-weather rider. DUDE.

New Barnet.

IS THE LONG EXHAUST A SILENCER?

Sir,—In your issue of November 25th "W.G." makes enquiry concerning long exhaust pipes.

I ride a 3½ h.p. Sports Norton motor cycle. Lately I received a summons for inefficient silencer. The machine is fitted with the Norton standard exhaust pipe, with no silencer box, and only the fish-tail baffle at the end. The pipe itself comes under the heading of an expansion chamber, because its cubic capacity is two and a half times the cubic capacity of the cylinder, and also the fish-tail at the end is larger than the rest of the pipe, upon which it slides.

Probably other readers have been summoned for the same alleged offence. In my case the summons was dismissed as being no case. C. R. BIRD.

[Although our correspondent has evidently been able to prove that a long exhaust constituted a silencer, other local authorities may hold different views. We therefore warn our readers that the safest way to keep within the law on this point is to ensure that their machines are reasonably silent.—ED.]

OLYMPIA IN FIGURES.

Sir,—As the correspondence columns of *The Motor Cycle* represents the motor cyclists' forum, I take the liberty of criticising certain makers who still produce motor cycles woefully under tyred. The interesting statistics you gave last week show that among the exhibitors at Olympia no fewer than seven makers have lightweights equipped with 26×2in. tyres, while no fewer than thirty-two used the 26×2¼in. size. With such a large majority in favour of the latter size it must be obvious to the minority of makers that they are out of date. Why do they do it? Is it price? I think not, for some of the machines fitted with the smaller tyre are not among the cheapest.

The same applies to the 24×2in., and 24×2¼in. size; only four makers favour the former as against seventeen who fit the latter.

It is interesting to see that the once favourite size of 26×2⅜in. is practically moribund, and that the 26×3in. size is coming into favour.

No doubt there is an explanation why some makers prefer 28×3in. to the 700×80 size, which is a "fatter" tyre, and is no more costly. Probably the former size is favoured on account of the possibility that replacements can be obtained readily overseas.

The analysis of engines used by makers is most interesting. It is, I think, the first time such figures have appeared, and although thirteen makers use more than two engines, it is shown that no fewer than forty makes use one size of engine only, while thirty-three use two.

Often British manufacturers are criticised for not standardising, and their American contemporaries are cited as examples to be followed. May I remind these critics that both the Harley-Davidson and the Indian factories produce more than one size of engine. STATISTICIAN.

London.

AN ENTHUSIAST'S MINIATURE.

Sir,—I was much interested in "Mac's" description of this little machine, and would be glad of more particulars, gear ratios, and especially regarding performance on hills, which abound in this neighbourhood. High speeds I detest, but ability to ride everything that comes in one's way I appreciate very much—meaning roads on which any sane motorist would care to travel. I think the little machine, with a two or three-speed gear, would about fill the bill for a great many besides. SAFETY FIRST.

Barrow-in-Furness.

DIFFERENCES OF DESIGN.

Sir,—I read with interest the description in *The Motor Cycle* of the flat twin engine, designed by Mr. Bradshaw, and was particularly struck by the fact he has reverted to cast iron cylinder with aluminium alloy piston.

What do A.B.C. owners think of this? It would be very interesting if Mr. Bradshaw could give us his reasons for the sudden change, as when the A.B.C. machine was first marketed (in its present form), one of the claims for the title of the "World's best motor cycle" was steel cylinders and aluminium pistons.

If the two different designs were the separate idea of engineers of different views, one could understand it better, but coming as they do from the same source, one can easily be pardoned for being puzzled over a point which on the face of it seems absolutely contradictory. PUZZLED.

Guildford.

FRONT BRAKE POINTERS.

Sir,—I have been wondering if some of your recent correspondents have ever used an efficient front brake such as one acting on a dummy belt rim. I notice this type was fitted to several T.T. machines this year.

I have been using a brake of this type constantly since May this year, and I can assure them that it is a pleasant thought to be able to brake on a hill and yet have the whole retarding power of the rear brake to fall back on in emergency (and which can then be applied without danger). Of course, I do not suggest a front brake designed or adjusted to permit of locking the wheel.

There is another argument for a good front brake (perhaps not a very good one), and that is that, by using the front brake mostly, the rear brake is more likely to be in efficient condition.

The chief need is on a heavy solo on greasy hills where retarding effect is not enough, in which case the argument for two good rear brakes falls rather flat.

I should like to know if any of your readers have had any experience of the effect on belt slip of drilling holes in the pulleys of direct belt-driven machines, particularly variably geared ones. It appears to be done in the case of chain-cum-belt, but not with belt alone. Can anyone tell me why?

Devonport. W.F.B.

EVERYDAY RIDERS' WANTS.

Sir,—As a reader of your valuable paper for seven and a half years, I cannot let "Fed Up and Disgusted's" letter go past without criticising some of his opinions. Probably he owns a cycle made in the year "one," when the tanks were made in proportion to the reliability of the engine, as the latter was not expected to last without breaking down as long as the petrol. He should buy a modern machine that holds two gallons. I should also like to know what he means by freak gears. I have yet to find the British-made motor cycle with a gear box or gears that were not substantial if treated with a little bit of "savvy." Also what better front brake and spring frame does he want than those on a Beardmore-Precision?

It is easily seen that he is not an engineer, as he prefers plain bearings to roller or ball bearings. Commonsense would tell anyone that, from an engineering point of view, ball races and roller bearings are far superior to plain ones. They are less liable to wear, will not seize from lack of lubrication, they are sweeter running, and easier to fit. What engineer would prefer to turn and fit bronze bushes when ball races can be obtained in standard sizes, and will tap on and off as required, if the correct size? Nevertheless, I agree with him regarding agents' stocks of spares.

Glasgow. EASILY SATISFIED.

"OLD CHALKEY" OR CHALK PIT HILL?

Sir,—Having read Mr. E. M. Wright's letter in your issue of November 18th, in which he runs down the performances of riders on Chalk Pit Hill in the M.C.C. sporting trial, I should like to make the following observations.

I believe I am right in stating that this hill was not Chalk Pit Hill at all, but one known as "Old Chalkey," a disused coach road. One thing is certain, that the sharp right-angle turn which caused Mr. Wright's failure never existed at all on the hill we had to climb. From what I can now recollect, the hill started with a watersplash, then yards of miry ruts, a fairly sharp left and then a stiff climb, the surface consisting of two deep and slimy ruts.

Had the surface been dry, there would have been little excuse for stopping, but with the surface as it was, continual wheel slip was inevitable, and walking without floundering practically impossible.

I think it is a great slur on the modern machines and all those sporting riders who were unlucky enough to stop their road wheels on this hill, for Mr. Wright glibly to infer that he could have climbed it without stopping or putting a foot to the ground on a fixed geared 3½ h.p. machine under the same conditions as we had to climb it.

I should like to see him traverse some of the unmade road sections on the level, or even down hill, without stopping his road wheels.

As to soldiers marching up Old Chalkey at "120 feet r.p.m.," I ask my fellow competitors what they would have looked like that Saturday morning?

Finally, I would advise Mr. Wright that, before he runs down our efforts and those of our machines, he should find the right hill, and tackle it on any fixed gear 3½ h.p. single under similar conditions, and then let us all know of his experiences. A. C. RHODES.

TESTIMONIALS.

Sir,—I have watched with interest and admiration the advertisement columns of your admirable journal: and should like to give voice to my keen appreciation of the marvels of modern machines and accessories as there recorded. More particularly, the undermentioned:

(1.) The enamel that won the T.T. and innumerable other races, trials, etc.

(2.) The spanner that won, etc.

(3.) The filler-cap that nearly won, etc. (Perhaps you could complete this list for me, and perhaps it would take too long!)

(4.) The more-than-two-wheeler that entered for a (speed) hill-climb, and "successfully completed the test!"

(5.) A passenger conveying apparatus sold complete, "no irritating extras"—but "without tyre!"

(6.) A well-known machine advertised by means of a quotation from a correspondent's letter to you, so arranged as to appear to be an expression of opinion—editorial opinion.

Perhaps I have said enough: I could go on for hours.

Might I suggest to the sales managers, etc., concerned that this sort of stuff does not deceive the people whose good opinions are worth having, but merely disgusts them?

In conclusion, sir, may I venture to hope that for 1921 the advertisers' motto will be, "Honest advertisements of honest goods"? SWALLOW ALL.

Grimsby.

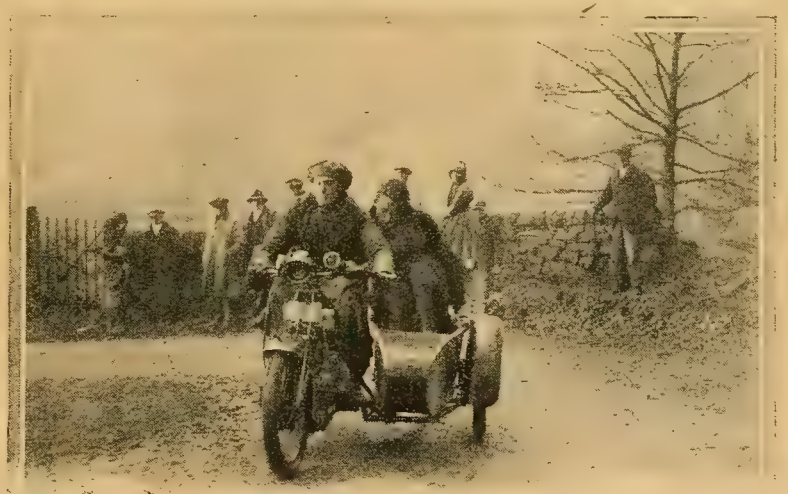
DAZZLING HEAD LIGHTS.

Sir,—I should very much like to have the comments of yourself and your readers on the following experience. The other evening—a clear moonlight night—I was riding solo along a country road when I met a sidecar outfit with an extremely efficient head light. My own head lamp is the middle size of a well-known make, and on ordinary occasions gives me sufficient light for comfortable travelling at night up to the legal limit of speed; but in the glare of the approaching searchlight it was but as a candle in sunshine. Outside the oncoming light I could see absolutely nothing ahead; but, as the sidecar outfit whizzed past my shoulder, there, clearly picked out by my own lamp, was the back of an unwitting pedestrian a few feet right in front of my wheel. I had no time to avoid a collision altogether; but, fortunately, the results were not so serious as they might have been. My fellow-sufferer had not heard my approach owing to the noise of the other machine, nor had he seen the light from my lamp, because, as he stated, of the glare of the other light.

What I should like information about is how to avoid such accidents in future. Should I invest in a new lamp of such high brilliancy as to hold its own with any competitor that may come against it? This might be satisfactory for me, but I have an uneasy feeling that some other less brightly lit motorist I met might have the same experience I had, for which I would reckon myself responsible. Should I, then, stick to my medium-powered lamp, and, on meeting again a travelling searchlight, stop and modestly wait till it has passed me? It hardly seems right that I should simply sound my horn and drive blindly on.

I think it preferable to have questions like these settled by friendly agreement among motorists rather than by outside legislation; but, failing the agreement, I should certainly welcome legislation. C. R. GIBSON.

[We believe that the question of dazzling head lights is already engaging the attention of the legislative authorities; but whether their findings will give satisfaction to the average motor cyclist is a very moot point. Considerate drivers nowadays usually set their glaring lamps at "dim" when passing other vehicles. But our correspondent appears to have met an acetylene-equipped outfit, in which case this courtesy would not be possible.—ED.]



ROWSLEY BANK IN NOVEMBER.

THREE-INCH TYRES ON LIGHTWEIGHTS.

Sir,—I note in your issue for November 18th that "Ixion" asks for experiences of riders who have tried large tyres on lightweights.

Personally, I own two machines—an 8 h.p. New Imperial and a Beardmore-Precision. I found that the big 'bus with its 28in. × 3in. tyres got nearer to the comfort of the spring frame Beardmore than other machine I have ridden, and I have tried most things, from the little 2 h.p. Precision Pup upwards. This led me to wonder if I could improve on the comfort of my small machine; so as I had a couple of 28in. × 3in. covers which had done duty on the back wheel of the New Imperial, but still were good for a good many miles, I fitted them on to the Beardmore. They fitted the 26in. × 2¼in. rims perfectly. I covered about 700 miles in the first week after they had been fitted, and must say that the improvement in comfort was most noticeable. In 1915 I used to run a 2½ Sun-Villiers as a private 'bus when I was despatch riding, and always fitted 26in. × 2⅜in. heavy tyres, which made a tremendous improvement in comfort over the 26in. × 2¼in. "light" covers fitted to the machine when I bought it.

Also, with big oversize tyres the puncture fiend is "mafeesh," as they say in Egypt. O.P.C.

Holsworthy.

Sir,—*Apropos* "Ixion's" remarks *re* 3in. tyres on lightweights, during the early part of this year I was riding a 2½ h.p. Cleveland two-stroke, and would like to testify as to its extreme comfort. There seems to be an absence of that rebound which occurred on several spring-framed machines I have ridden, due to the fact that the rear tyre can be inflated to suit one's weight. The Cleveland engine is beautifully balanced, and runs very sweetly indeed when not four-stroking; but, in my opinion, is marred by having fixed ignition and no compression release.

I am running a 1920 Velocette now, and a more delightful little machine I do not wish to own; being fast, powerful, economical, and the acme of reliability, it compares excellently with the fifteen machines of all weights and powers that I have previously owned.

The makers have wisely chosen 2¼in. tyres instead of 2in., and these, in conjunction with a saddle spring to suit one's weight, make the machine very comfortable indeed.

Bristol. U 5429.

Sir,—It seems "Ixion" has discovered that the Cleveland has 26in. × 3in. tyres, as it has had for over a year. On a sturdy lightweight they are ideal. When I must have a new tyre I will take a 27in. × 3½in., fitting the same rim.

The Hague, Holland. A. VAN DER MEE.

Sir,—Having read with interest "Ixion's" remarks on this subject, I venture to give my experiences. My first machine was a 4 h.p. single, fitted with 2⅜in. tyres. This machine—fast, powerful, and absolutely reliable—was extremely uncomfortable to ride for any length of time, and this, in conjunction with poor mudguarding, was the only fault.

My next mount was a 2¼ h.p. two-stroke, which only boasted 2in. tyres. This machine, with a well-sprung saddle and efficient front forks, was fairly comfortable except on roads with large pot-holes where the small diameter of the wheels (24in.) caused a lot of bumping. Considering the rate of wear, more especially of the back cover, the tyres were much too light for the work. I may mention also that one has to exercise considerable caution in the region of tramlines with such small tyres.

My present machine is an American lightweight with 26 × 3in. tyres. It is far more comfortable than the other machines, and the large treads render it very stable in grease. In spite of the fact that I have ridden this cycle a considerable distance, mostly with a pillion passenger, the tyre wear is negligible. These tyres call for far better guarding than do small sizes, and that on my 'bus is useless on a wet day. Considering mechanical efficiency and attention to finish and detail, the English machines are infinitely superior, but the Americans have a better idea of tyre fitting. WALTER B. PENNY.

Sir,—"Ixion," in the issue of November 18th, treads on some corns which have been awaiting his attention a very long time. I mean the size of tyres on a lightweight. I think it is an absolute scandal for any maker of a motor cycle weighing upwards of a hundredweight to put it out with anything under a 2¼in. tyre, and a heavy one at that.

My personal choice is a two-stroke Enfield; and the first week or two I rode it I was on the point of selling it several times, simply because if the tyres were not pumped up hard enough, they pinched on the rim and cut both cover and tube.

I went to the local Palmer Tyre people and got the 2in. tyres replaced with 2¼in., and from that day to this the machine has been a perfect treasure to ride, and I have not had a single puncture. J. STUART-WHITE.

ELECTRIC LIGHTING FOR SOLO LIGHTWEIGHTS.

Sir,—I have been exceedingly interested in the Correspondence columns of *The Motor Cycle* dealing with electric lighting for motor cycles; but, after reading all the letters on the subject, I have turned away disappointed, for they deal with electric lighting for a sidecar, and leave the lightweight severely alone. There must be many riders like myself who require an electric lighting outfit which is cheap and efficient. I know there are several sets marketed by well-known firms, but these sets usually top the £6 mark, and make use of dry batteries, which are expensive to replace.

I will try and explain a set which, I think, might appeal to many riders who do not go in for long night rides, but who are often caught ten miles or so from home at lighting up time, have to dismount, and spend perhaps a quarter of an hour lighting and regulating their acetylene lighting outfit.

I have (probably like many other riders with slender purses) formed vague ideas of an ideal, cheap, and efficient electric lighting set, and I will try and give them below. If I name a certain make of lamp or accumulator, it is not because I am interested in it, but because I had it in mind when my ideas were forming.

Head lamp. Hunt's model 870, price 23s. Small, I admit; but, I think, large enough for the purpose.

Accumulator. Four-volt Bipol, giving fourteen to sixteen hours' light. Price 16s. (recharging, 6d.).

I think that the accumulator should be carried in a case attached to the handle-bars in the same position as an acetylene generator. It should be divided into two compartments, so that two accumulators could be carried (one spare).

Bulb. A four-volt half-watt.

Now we come to the rear light. I intend that this shall be entirely separate from the head lamp, thus doing away with yards of wiring.

An electric cycle rear lamp, cost about 10s. 6d., used in conjunction with a Bipol pocket accumulator. Price, about 4s. 9d. (recharging, 3d.); whilst a spare accumulator should always be carried. These accumulators give, I believe, about eight hours' light. The total cost of the outfit is under £4.

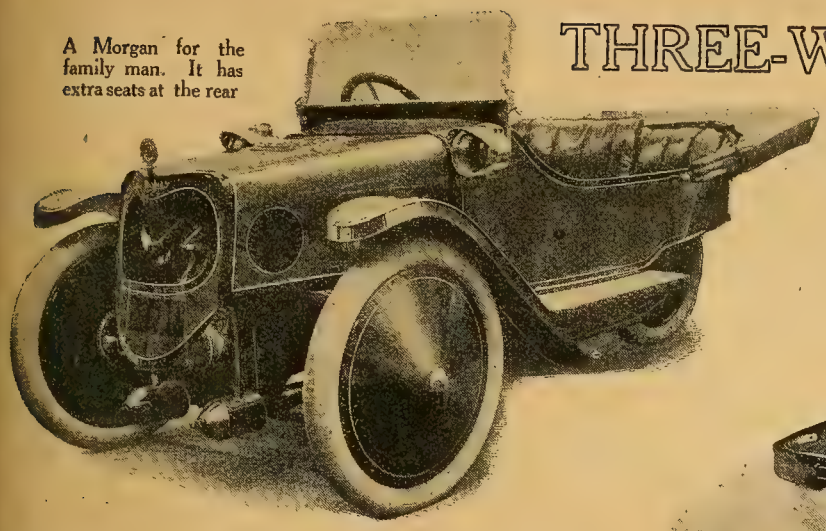
THREE-WHEELERS AT OLYMPIA.

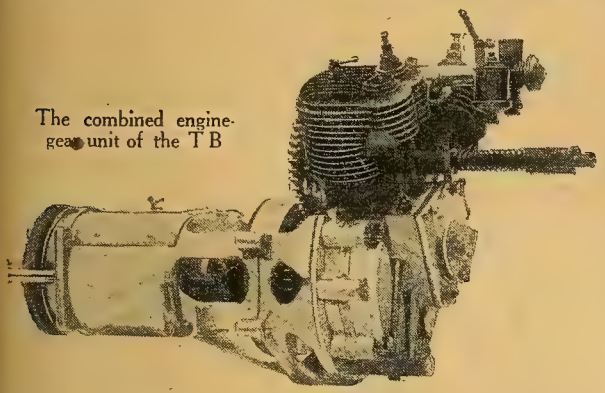
A Review of 1921 Runabouts.

By B. H. DAVIES.



A Morgan for the family man. It has extra seats at the rear

TWO names leapt to the Editor's mind when he decided to publish a *revue* of the three-wheelers at Olympia. Their scope and future are so keenly debated at the moment that either Mr. A. J. Balfour's philosophic doubt, or Mr. Asquith's attitude of postponed observation would have fitted the job like a glove. Since neither of these gentlemen is seriously interested in economical motoring,

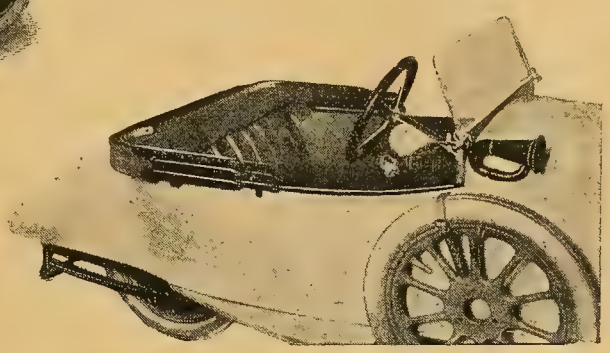


The combined engine-gear unit of the T B

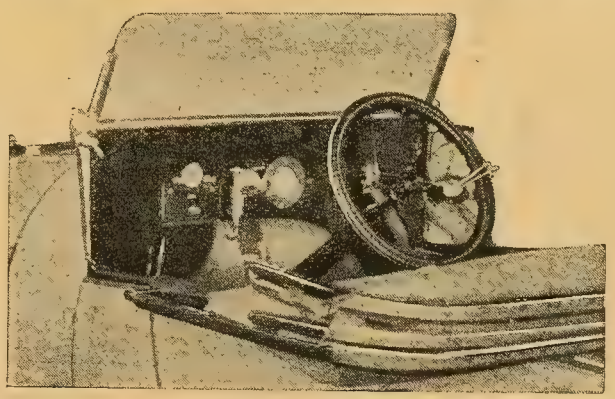
the Editor fell back on me. Some experts hold that the sidecar outfit will gradually be eliminated by the three-wheeled car. Other authorities consider that elaborate three-wheelers listed at £275 or thereabouts will never sell freely against such cheap four-wheelers as the Tin Lizzie and the 8 h.p. Rover. One man asserts that only a light, simple three-wheeler is any good, and that nobody but Morgan can plan such a specification. Then somebody else avers that the more elaborate a three-wheeler is, the better—provided it is decently designed and made. Obviously nobody short of a Balfour or an Asquith could do justice to such a tangled situation. This modest scribe must be content to deal with facts and factors.

Economy Advantages.

First and foremost, if we omit the Dayton bath chair and the Warrick parcel car (as catering for special markets), there are eight different makes of three-wheelers at the Show—that is, eight firms staking their plant and capital on the future of these vehicles, and some of them are firms whose opinion carries very considerable weight. Let us set them out—Morgan, Scott, New Hudson, Coventry Premier, T.B., Castle Three, L.S.D., and Stanhope. Compared with the best sidecars, they claim great and obvious advantages in sociability, cleanliness, and weather protection. Compared with cheap cars, they show great economy in running costs—a tax of £4 (as against £21 for a Ford): and a fuel consumption of not less than 50 m.p.g. (as compared with the 25 m.p.g., which is a sanguine estimate of the average Ford consumption). They need fear no rivalry from the standard types of British light car, which interfered with the three-wheeler market in 1914, but cost £200 more. So far as sociability goes, would you rather take your best girl out on a pillion, after the

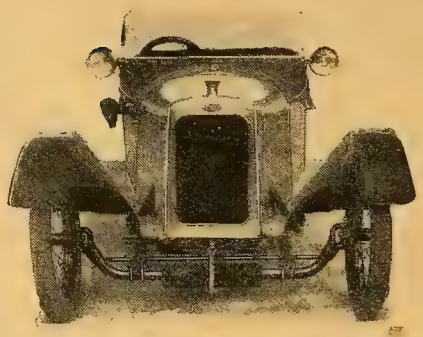


The seating accommodation of the Castle-Three is identical with that of a car.



Viewed from the driver's seat, the T.B. gives one an impression of a fully fledged car

fashion of King Arthur's knights, or in a 10 h.p. Singer? So far as weather protection goes, would you rather be a parrot on a perch, or a pet pug in a plush-lined case at a dog show? If you were taking on a delivery job for Harrods in December, would you rather have your parcel car fitted up on a Morgan chassis, or coupled to the best motor cycle ever made? We are all extravagant in our pleasures, but the exhibits prove that the trade expects a distinct boom in commercial parcel cars, both in sidecar and tricar chassis. In that sphere running costs are decisive. It is surely clear that the three-wheeler has a unique opportunity, which good design and good workmanship can easily exploit.



Another three-wheeler that closely follows car lines when viewed from the front is the Coventry Premier.

The Search for Ideals.

Taking the continued success of a few elect three-wheelers for granted, we are met by a medley of ideals upon the correct specification. No two designers are agreed upon the best type of engine, suspension, frame, or transmission. Their disagreements don't disturb me in the least. The three-wheeler is still juvenile (barring Grandpa Morgan), we can't expect design to be stereotyped, and variety is a thoroughly healthy sign. A glance at some of the opposed ideas may be interesting. There are three main types of frame. The simplest is found in the New Hudson and Coventry Premier—a channel steel parallelogram, braced with diagonal tubular struts. A second type is more reminiscent of an aeroplane fuselage—three or more steel tube longerons, braced by pressed steel bulkheads, or by tubular cross struts, as in the Morgan and T.B. The third pattern is the Scott triangulated tubular chassis. All three are obviously workmanlike productions. The engines are of three types: water-cooled four-cylinder (Castle Three), vertical two-stroke twin (Scott), and air-cooled V (all the rest). The four is the bulkiest, the most expensive, and the most refined. The air-cooled V is cheap, good, and easily kept in order. The Scott is an attempt—as yet not publicly proved—to combine the merits of both its rivals. The divers methods of suspension contain little which has not long since made good on four-wheelers. The various drives are all familiar and sound. The two-chain gear of the Morgan is the lightest and cheapest, thoroughly satisfactory with a light chassis behind it; and in return for these advantages it demands periodic routine attention from

TRANSMISSION SYSTEMS OF THREE-WHEELED RUNABOUTS.

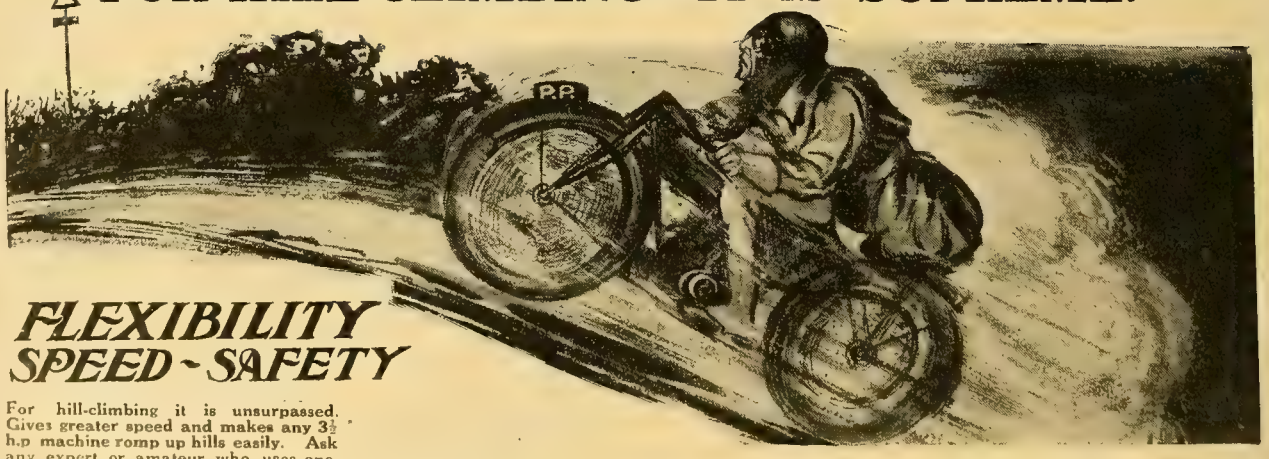
THE WORLD-FAMED PHILIPSON PULLEY.
FOR HILL-CLIMBING—IT IS SUPREME.



FLEXIBILITY
SPEED - SAFETY

For hill-climbing it is unsurpassed. Gives greater speed and makes any 3½ h.p machine romp up hills easily. Ask any expert or amateur who uses one.

No alterations will be made for 1921.

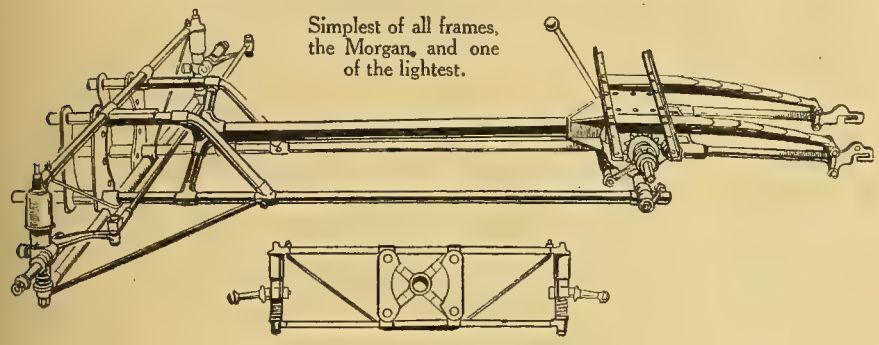
Extract from "The Motor Cycle," November 25th, 1920.

While the direct, belt-driven "3½" is nowadays regarded as a survival, no sweeter running and more flexible mount can be imagined, especially if the Philipson pulley is used. To the man who "travels light" and confines his week-end kit to a tooth-brush and a safety razor, it makes a touring mount which teaches the joy of living.

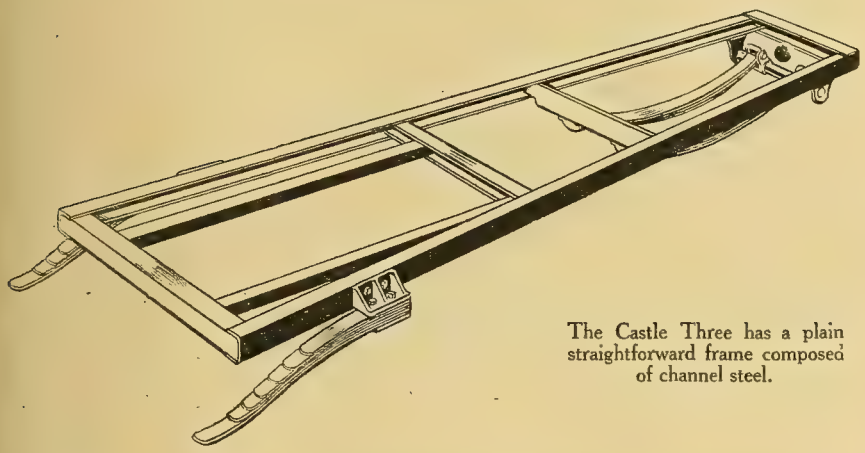
Only Two Working Parts. No other gear can compare in simplicity. Fitted to Belt-driven Machines by anyone in a few minutes. **Price £8-8-0** Carriage Paid. Send for Illustrated Booklet. *Telegrams: "Safety, Bolton." Telephone: Eagley 147.*

PHILIPSON & CO., LTD., Astley Bridge, BOLTON, Lancs. (Established over 40 years)

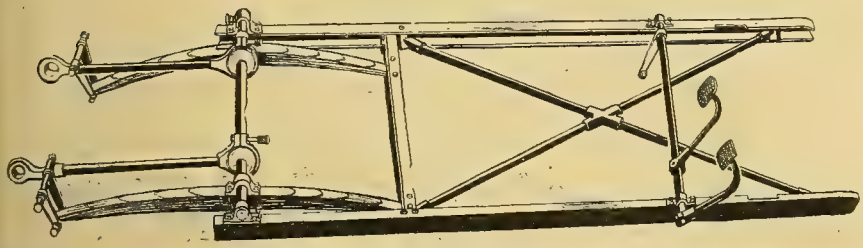
CHASSIS DESIGNS OF THREE-WHEELED RUNABOUTS.



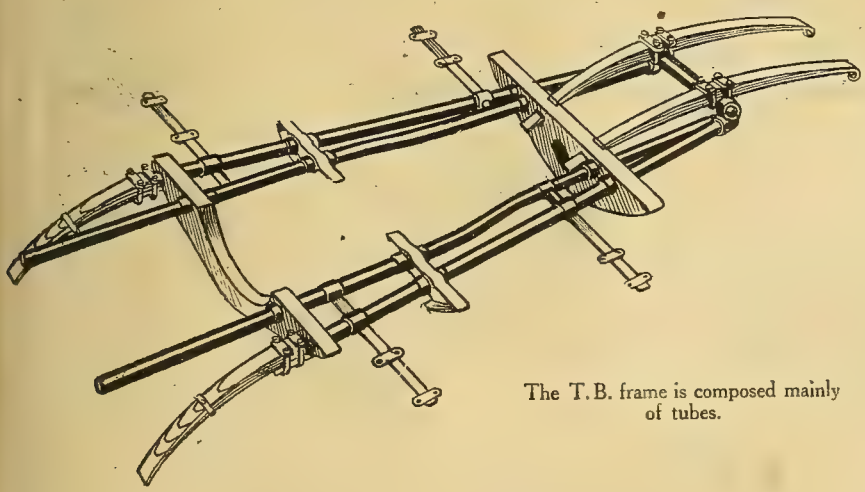
Simplest of all frames, the Morgan, and one of the lightest.



The Castle Three has a plain straightforward frame composed of channel steel.

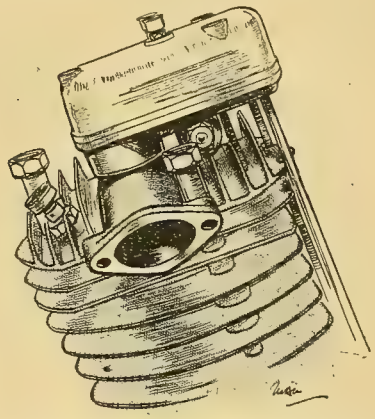


Channel steel and tubes are used in the frame of the New Hudson



The T.B. frame is composed mainly of tubes.

its driver. The three speeds and reverse, shaft, and chain on the New Hudson require less notice from the owner, but will need a professional mechanic's attention every year or so, whilst their weight and cost are higher. The keynote of the leading three-wheeled chassis is variety within a circle of commonsense. They are inspired by different policies, they appeal to different tastes: but they embody nothing which is unsound or even experimental. Their future will be governed rather by sentiment and finance than by any technical considerations. Much will turn upon the results of the 1921 competitions. Until now, the Morgan has enjoyed itself much as Field-Marshal von Mackensen did in the great war. It has had to wrestle with roads



Detachable cylinder head rocker arms and enclosed of the New Hudson twin

and climates, but it has never had to tackle a rival of its own class. The newcomers were not ready last year. In 1921 the passenger class in the Six Days may with luck include some two dozen tri-cars, and the Morgans will really have to fight rivals as well as roads. When that trial is over, we shall know whether extra weight is an asset or a defect: and we shall know how faithfully and wisely *the detail work of the newcomers has been executed*. Their outlines are obviously sound: it is by their details that they will succeed or fail. However, given the detail work, there is no reason why they should not all survive.

Turning to some of these details, the old snag of tyre inaccessibility is being grappled with. All the single wheels are readily detachable, and on several

machines—*e.g.*, the Scott, T.B., and Castle Three—the front and rear wheels are interchangeable. In such cases one spare wheel reduces a puncture to a very trivial matter, and vastly improves the mental comfort of bad weather driving. On those machines where the wheels are not interchangeable, a reserve inner tube will shorten the inevitable tyre stops.

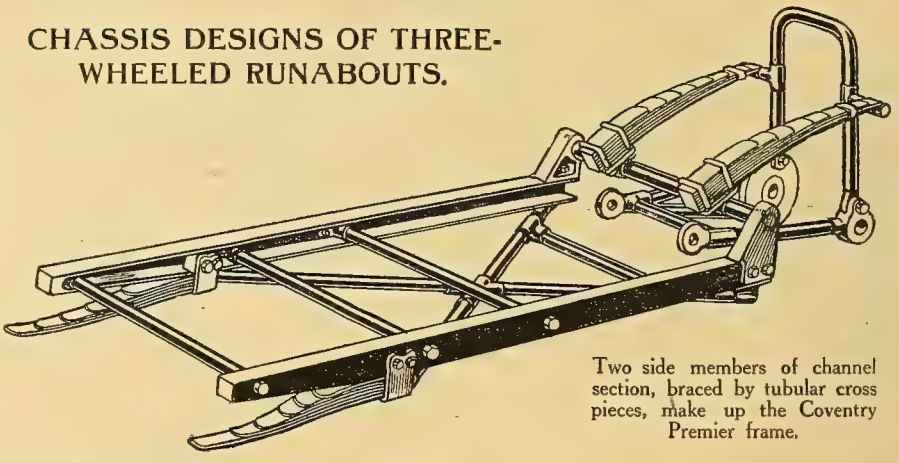
Starting.

Engine starting has been another bugbear of the cheap cycle car. A big V twin is not the pleasantest handle-starting proposition for a weak man or for any woman. The New Hudson has a non-detachable handle connecting with the camshaft; the T.B. has a similar handle operating on the kick-starter principle and geared 2 to 1; the Castle Three has a four-cylinder engine—very easy to start, given decent time; and the Scott engine requires coaxing rather than effort if it should ever turn sulky. These are small points, but they count heavily in sales.

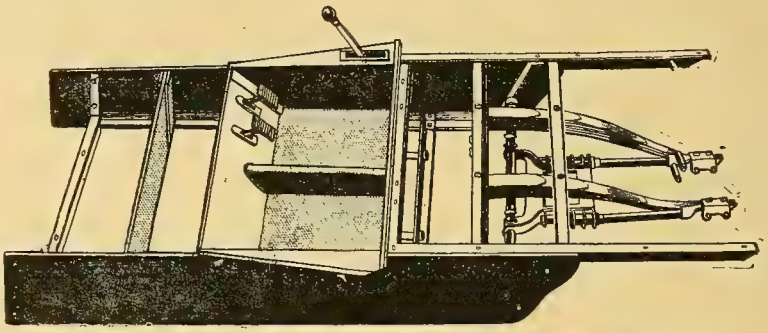
Ease of Entry.

Or take ease of entry. I do not think any three-wheeler at the Show scores quite full marks on this question of convenience. Imagine a rainy day. There is no engine-starter. There are no side doors. The hood is up. You have a traffic stop. The engine chokes. The detachable handle is, maybe, under the seat-cushion. Four taxis and three motor 'buses are using regrettable language just astern of your tail. It is thus that the seeds of divorce suits are sown. But with two side doors and a handle permanently mounted, things are not quite so bad. This, of course, does not apply to the Scott Sociable, which has the starting lever inside the body.

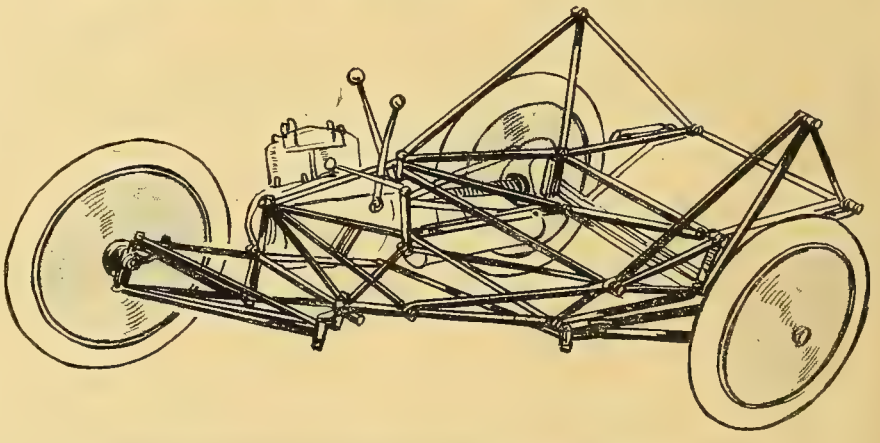
CHASSIS DESIGNS OF THREE-WHEELED RUNABOUTS.



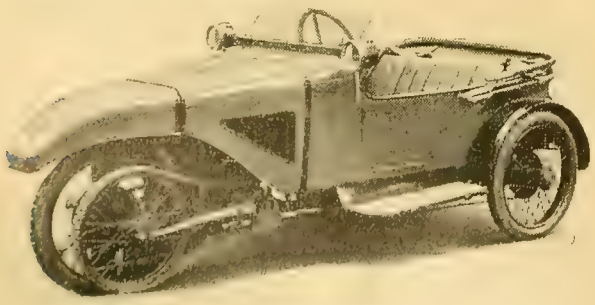
Two side members of channel section, braced by tubular cross pieces, make up the Coventry Premier frame.



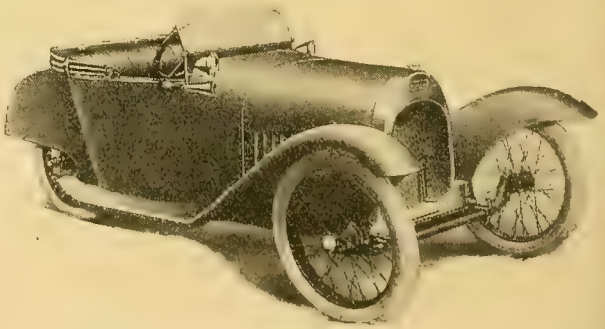
Steel side plates and angle cross members form the frame of the L.S.D.



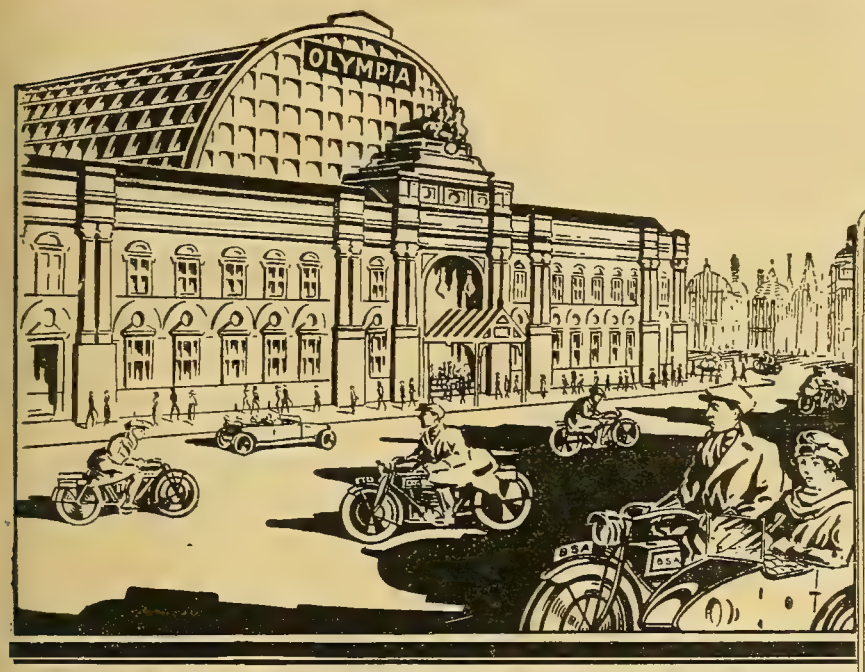
Triangulated tubular construction makes the Scott Sociable appear complicated.



The front wheel-driven Stanhope, a well-built machine now entering the market.



Latest of the three-wheelers, the New Hudson, is in every way up to date.



B.S.A.
MACHINES
were undoubtedly the centre of attraction at
OLYMPIA.

B·S·A

New Engine Detail and Sidecar

form the chief alterations on the famous B.S.A. 4¼ h.p. Model. The various new features further enhance the efficiency of the famous B.S.A. 4¼ h.p. Model, which, it will be remembered, won the Team Prize in the 1919 A.C.U. and 1920 Scottish Six Days, and 5 Gold Medals with 5 entries in the 1920 A.C.U. The new B.S.A. Sidecar is of exceptionally graceful appearance, and affords the maximum of riding comfort and luggage capacity. In every detail the 1921 B.S.A. 4¼ h.p. follows out B.S.A. practice with regard to excellence of material and workmanship.

Three Wheelers at Olympia—

For convenience of starting, the Morgan has an exhaust valve lifter on the side of the body.

To conclude with a list of interesting, but petty items, reverse gears are provided on the New Hudson, T.B., L.S.D., and Coventry Premier (the Scott has such a small turning circle that it never needs to reverse; it can make rings on a bread trencher). The T.B. steering column is adjustable for height. The Castle Three has Ford type steering gear, and its gear control is also reminiscent of the Ford—*ergo*, almost foolproof. Its back wheel can be withdrawn through the hinged tail, obviating the need for jacking up really high. The Coventry Premier can tackle a day's run without any lubrication anxieties, thanks to its capacious sump. The Morgan will probably feel no anxiety about its speed reputation: fast as some of its rivals claim to be, its light weight should assure its invincibility on hills. It can also claim the only four-seated body in its class. The L.S.D. has a very sturdy frame, and a motor cycle type of rear wheel stand, in lieu of the loose jack needed on other makes.

The Stanhope has a unique transmission and steering. Its twin rear wheels render the chassis specially suitable for heavy commercial loads, quite a big van body can be fitted without fear of rolling, and the height of a front box on a more conventional chassis is limited by the driver's need of vision. The New Hudson is a most attractive layout, with a new engine specially designed for the job, a gear box planned for easy changing, and an external band brake which doesn't rattle or bind. The shaft drive in the T.B. permits one brake to be located amidships, thus simplifying the rear hub; its rear frame has three pivots, each provided with a greaser (some machines have no such provision). The Scott weighs less than 4 cwt. complete, which is probably even lower than the Morgan figure.

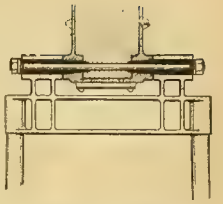

Diagram of the cone mounting of the rear fork hinge in the Morgan gear box.

I think we are all eager to see these machines fight out a big trial. Those which lay the foundations of a good name will have to fight afresh for supremacy in 1922, when—if rumour can be trusted—there will be further aspirants for fame in this class of passenger machine between the sidecar and the light car.

ECHOES OF THE SHOW.

Disconnected Observations concerning Last Week's Exhibition at Olympia.

DOES your machine weigh under 200 lb.? This simple question did not always produce satisfactory answers, but various devices were employed to render such queries unnecessary. One firm suspended their lightweight model from a spring balance. Another adorned the number plates with the weight of the machine in gold letters. A few produced weighbridge certificates, and at least one firm stated that the heaviest machine in their exhibit was well under the 30s. mark.

The standardisation of catalogue "horse power" is much to be desired. The non-technical public may be forgiven for wondering why engines of approximately 1,000 c.c. should be variously styled 8 h.p., 7-9 h.p., and 8-10 h.p., also why 500 c.c. engines should vary from 3½ to 4¼ h.p. in rating, and why the same engine should be rated differently when installed in various makes of frame.

A real lightweight motor cycle at last! The new two-stroke J.E.S. weighs but 80 lb., and is not a pedal cycle with motor attached. Obviously, it would be possible to produce a two-speed model at under 100 lb.

Opinions on the Scott Sociable varied to an enormous extent, as is usually the case with a startlingly new design. It was variously described as the best engineering proposition in the Show, a mass of brains and tubes, and Accles and Pollock's delight. May we add that, in our opinion, the first of these descriptions comes nearest to hitting the nail on the head.

It was good to see Mrs. Knowles looking quite herself again after the accident which befell her at the close of the Six Days Trials. It is understood that, since ladies are debarred from competing in the London-Exeter run, she will undertake the trip as a sidecar passenger.

Sectioned engines always attract attention, and there are many who now realise that the Villiers flywheel magneto still functions with some vim, despite its skeleton-like appearance when the cover is removed.

While most manufacturers are struggling to reduce weight, it is interesting to note that the simple single-geared Levis remains one of the lightest propositions exhibited, and fully acts up to its name.

Open-frame models for the use of the fair sex are on the increase, and already there is a wide choice for those who require a light and handy runabout.

On Thursday afternoon last Prince Purachatra of Siam, accompanied by Major Stanley, visited the Motor Cycle Show. He was received by Messrs. Harold Bowden and W.G. Bower, vice-presidents of the Manufacturers' Union, and by Major H. R. Watling, the general manager.

His Royal Highness is a keen motorist, and is particularly interested in light cars. He stayed in the Show for over an hour, and concentrated chiefly on the principal makes of motor cycles and three-wheelers, and at the conclusion of his visit he expressed the opinion that it was a very fine show.

"To buy, or not to buy, that is the question:
Whether 'tis nobler in the mind to suffer
The stony stare of irresponsive 'bus men,
The taxi-driver's scorn, and underground
To shuffle meekly farther down the car,
Or to shell out the sleek and glossy Fishers
And buy a motor bicycle? To mote!
Perchance to skid: ay, there's the rub.
But here I see are tyres that men say
Will go with even keel through mud and snow,
And road improvements—'tis a consummation
Devoutly to be wished."

—*Daily News.*

As has been previously mentioned in *The Motor Cycle*, there is a good deal of motor cycling in sunny Spain, but the country does not apparently offer the same facilities for visitors on motor cycles as others in Europe. At the Show we had a few minutes' talk with Mr. Geoffrey Hill, who was one of the competitors in last year's Paris-Nice Trial. He has had to abandon his Scott in Spain pending a discussion with the Customs authorities. He brought the machine from Italy to Spain by sea, and it appears that when any motor vehicle is brought into the country by sea a duty has to be paid, and there is no possibility whatsoever of getting this refunded when leaving the country. Mr. Hill also informed us that the conditions of the roads are appalling, and his advice to those who intend to visit Spain is—Don't!

CURRENT TOPICS

Times to Light Lamps.

Police Activity in Peterborough.

We hear that there is considerable police activity in Peterborough. Licences particularly are being asked for, and motor cyclists are being summoned for driving to the common danger.

Essex M.C.

The annual dinner has been arranged to take place at the Royal Venetian Room, Holborn Restaurant, W.C., on Saturday, January 8th, 1921, at 7 p.m. Mr. S. G. Cummings will take the chair.

The annual general meeting will take place at the Royal Automobile Club, on Thursday, December 9th, at 7.30 p.m.

Reward for Stolen Machine.

A reward of £10 is offered by the Autocar Fire and Accident Assurance Co., Ltd., of 77, Cheapside, London, E.C., to the first person who gives information which leads to the recovery of a motor cycle as stated hereunder, and the apprehension of the thief or thieves:

Triumph No. DU 212, engine 48,863, frame 275,895, magneto 8,504, the usual Triumph colours, rear portion of tank covered with a green leather cloth, three-speed countershaft gear, believed 1918 pattern.

The Road Bill.

If all the Ministry of Transport's proposals for the new Road Bill eventually come into force, the lot of the motor cyclist, like that of the policeman, will be "not a happy one." For instance, it is proposed that a penalty of £50 may be imposed on the owner of a motor vehicle for allowing his licence card to become obscured. Similarly, a fine of £100 or six months' imprisonment is proposed for licence declarations which are "misleading in any respect," and the burden of proof of innocence lies with the owner. Since the maximum penalty for any similar offence under the existing Motor Car Act is £10, these estimates appear to be excessive. We have no desire to encourage motor cyclists in attempts to defraud the revenue, but mistakes are bound to occur through misunderstandings of the regulations, and there are comparatively few motor cyclists who could afford to pay such fines.

It is proposed that the bulk of the revenue from the new taxation shall be devoted to road maintenance. This is as it should be, but the Minister of Transport will have power to close any road against any specified class of traffic, so that motorists may have to pay for roads which they are prevented from using.

The Motor Legislation Committee are taking an active part in warning motorists of these and other dangerous features of the Bill.

Overseas Trade.

An advance copy of an interesting booklet issued by the Department of Overseas Trade has reached us. Its contents will be of interest to all exporters, since they deal with the work of the Department and its methods of providing assistance. Copies may be obtained by manufacturers and traders of the United Kingdom on application to the Department of Overseas Trade, 35, Old Queen Street, Westminster, S.W.

No speed limit here! A Griffon rider in last week's Circuit de Paris Reliability Trial going through the speed test on a perfect stretch of road.

SIDECAR PROGRESS.

Important Events in 1921.

The dates of next year's open and other classic events have now been tentatively arranged by the A.C.U. in conjunction with clubs concerned. These fixtures are amongst those which will receive the support of the trade. All are open competitions with the exception of those organised by the M.C.C., and there are a few remaining events still to be decided upon and allocated at a later date.

Feb. 12th.—One Day Winter Trial, A.C.U.
Feb. 25th.—A.C.U. Silencer Trial, Brooklands.
March 25th (Good Friday).—Richmond Meet (Yorks.).
March 26th.—M.C.C. Jarrott Cup Trial.
March 28th (Bank Holiday).—East Midland Centre A.C.U. Speed Trials.
April 23rd.—Midland Centre A.C.U. Reliability Trial.
April 30th.—North-eastern Centre A.C.U. Reliability Trial.
May 7th.—B.M.C.R.C. Open Meeting.
May 14th.—M.C.C. London-Edinburgh.
May 20th-21st.—Western Centre A.C.U. Two Days Reliability Trial.
May 28th.—East Midland Centre A.C.U. Speed Trials.
June 14th-16th.—T.T. Races.
June 25th.—M.C.C. Inter-team Trial for *The Motor Cycle* Cup.
July 2nd.—North-western Centre A.C.U. Hill-climb.
July 6th-7th.—Arbuthnot Trophy Trial (provisional).
July 16th.—Yorkshire Centre A.C.U. Reliability Trial.
July 30th.—North-eastern Centre A.C.U. Speed Trials.
Aug. 6th.—B.M.C.R.C. Open Meeting.
Aug. 8th.—International Six Days Trial, Geneva (provisional).
Aug. 20th.—Western Centre A.C.U. Speed Trials.
Aug. 25th.—Welsh Open Speed Championship.
Aug. 27th-Sept. 3rd.—Six Days Trials.
Sept. 8th.—Norfolk M.C. and L.C.C. Speed Trials.
Sept. 10th.—North-western Centre A.C.U. Speed Trials.
Sept. 17th.—Midland Centre A.C.U. Reliability Trial.
Sept. 24th.—M.C.C. Sporting Trial.
Oct. 1st.—Yorkshire Centre A.C.U. Speed Trial or Hill-climb.
Dec. 26th.—M.C.C. Winter Trial.

Proposed Hertford and District M.C.C.

It is suggested that a motor cycling club be formed in Hertford, Hoddesdon, and Waltham Cross district, and all interested are asked to communicate with Mr. D. C. Archer, "The Hawthorns," Hoddesdon, Herts. If adequate support is forthcoming, a meeting will be arranged to discuss the formation of a club.

Newcastle M.C.

Proving a highly successful gathering, the Bohemian concert of the Newcastle Motor Club was held recently at the Central Exchange Hotel. Mr. Joseph R. Scott, the president, was unable to attend owing to ill-health, and Mr. James Daglish, of Wallsend, took the chair. Mrs. Daglish presented the prizes to the successful competitors during the season.

Mansfield and District M.C. and L.C.C.

The above club has decided to run a speed trial on the well known Clipstone Drive on Boxing Day, December 27th. The following events will be run, on time only, over a distance of half a mile, with a flying start of about 400 yards: 275 c.c., 350 c.c., 500 c.c., 750 c.c., unlimited c.c., and unlimited sidecar, and a special class for Ford cars. The above events are open to any member of the club. Entry forms will be ready in a few days, and may be obtained from the hon. sec., Mr. G. Mills, 16, Hall Street, Mansfield.

Bradford M.C. and L.C.C.

The above club had a very successful social evening on Thursday, November 25th. The entertainment consisted of a set of lantern slides, all photographs of motor cycling events, and, in addition, several films were shown, the cinema apparatus having been kindly lent by Mr. Eric S. Myers, of Bradford. The British Excelsior Co., of Birmingham, kindly forwarded their private film of "Clovelly High Street," and the Scott Motor Cycle Co., Ltd., their films of the 1919 and 1920 Scott trials, whilst several lantern slides were also shown of the club's own event on Rosedale Abbey Bank.

Mr. Felix Scriven, one of the founders of the Bradford Club, gave a very interesting lecture on "Motor Cycles of Years Ago," and Mr. J. N. Longfield (president of the Ilkley Club and also a member of the Bradford Club) spoke in his official capacity of chairman of the Yorkshire Centre A.C.U.

Several members of the Leeds and District Club came over specially, and about twenty more new members were enrolled.

The large room at the Belle Vue Hotel, Bradford, the club's headquarters, was packed to the door.

Proposed Rhyl M.C.C.

An informal meeting of motor cyclists was held recently at Whitaker's Garage, Rhyl, when it was decided to form a club for Rhyl, Prestatyn, and Abergele.

Bristol M.C.C.

The officers for the coming year are as follows: President, Mr. W. Carter; vice-president, Mr. C. T. Pearce; captain, Mr. R. Passey, Cheddar, Som.; vice-captain (competition), Mr. A. V. Tozer, 9, Raymond Road, Victoria Park; vice-captain (social), Mr. A. W. Rankin, Ivanhoe, Wick Road, Brislington; hon. treasurer, Mr. A. G. Mason, 109, Berkeley Road, Bishopston; hon. secretary, Mr. Rex Poweraker, 23, Claremont Road, Bishopston; and assistant hon. secretary, Mr. H. F. Scamp, 49, West View Road, Chessels, Bedminster.

Jersey M.C.C.

Reliability trials are not easy to arrange in a small island, but the above club held a successful autumn trial in the middle of November. Route marking was by whitewash arrows, this being very well carried out by Mr. R. Quenouillere. Results:

1, D. L. Caudey (4 W.D. Triumph), 220 marks; 2, G. de la P. Hacquett (6 A.J.S. sc.), 214 marks; 3, J. Varney (2¾ Sun), 196 marks, these riders winning the solo, sidecar, and lightweight classes respectively.

Other finishers were: R. O. Binet (4¼ B.S.A.), E. C. Oldham (4 Triumph sc.), W. Simmons (2¾ Verus), A. Harrison (4 Triumph), J. Rimeur (2¾ Douglas), C. M. Lanelick (2¾ A.J.S.), V. W. Bryant (3½ Brough), and R. P. Simon (4 Triumph).

North London M.C.C.

The first winter event was held at the Orange Tree, Friern Barnet Lane, taking the form of a lantern lecture. A series of slides were exhibited illustrating motor cycling events which have taken place during the year. Mr. Bernard Staley gave a short description of each slide, and read a history of the evolution of the motor cycle from 1885 to the present day. Messrs. H. R. Harveyson and R. H. Baxter were present and supplied many interesting details.

North Eastern Centre A.C.U.

A social gathering of the motor cycling members of the A.C.U. North Eastern Centre will be held at Durham on Sunday, January 16th, 1921. There will be a lunch, to be followed by a meeting, at which the presentation of prizes for competitions run during 1920 will take place. Many prominent motor cyclists are expected to attend, and during the meeting opportunities will be given for expressions of opinion on motor cycling matters in general and competitions for 1921 in particular. Each member is entitled to take a friend, and ladies are especially welcomed.

Tredegar M.C.

Tredegar Motor Club, one of the strongest organisations in South Wales, held its annual dinner at the Castle Hotel on November 24th.

Berwick and District M.C.

The first annual dance of this club was held recently at the Corn Exchange, Berwick. It was very well attended and included representatives of the Newcastle and District and Kelso Motor Clubs.

Barnsley and District M.C.C.

On Thursday, November 25th, this club held its first annual dinner. A most enjoyable evening resulted, during which prizes were presented to members who had won events in the past year.

Portsmouth and District M.C. and L.C.C.

It has been suggested that the above club be formed to arrange sporting and social events in Portsmouth during 1921. Application will be made for affiliation to the A.C.U. Will interested motor cyclists and light car owners please communicate with Mr. M. J. Tanner, Elbury, Milton Road, Portsmouth, who will arrange a meeting if sufficient support be forthcoming.

Reigate M.C.C.

It has been suggested that a motor cycling club be formed in the borough of Reigate. A meeting will be held at the Warwick Hotel, Redhill, on Thursday, December 9th, at 7.30, with a view to arranging sporting and other events for the forthcoming year. The large number of motor cyclists in this district would seem to warrant the step, and should ensure its success. Any further information will be gladly furnished by Mr. E. P. Duplock, 15, High Street, Redhill.

Basingstoke M.C. and L.C.C.

The second annual dinner and prize distribution of the above club took place on Tuesday, November 23rd, at the Station Hotel, Basingstoke. About forty members and friends (including ladies) sat down together. Immediately following the dinner, Mr. H. Julian (late Mayor of Basingstoke), chairman, kindly presented the cup, medals, and other valuable prizes, awarded to members won in recent competitions during the past season, and, in doing so, remarked on the wonderful success of the club, including the magnificent display of prizes, worthy of any club in the country. The concert following was of a very varied nature and thoroughly enjoyed by all. At 10-30 the National Anthem and "Auld Lang Syne" terminated on enjoyable evening by an enthusiastic club.

NEW HINTS FOR OLD HANDS.

Some Conveniences and Gadgets Worth Trying.

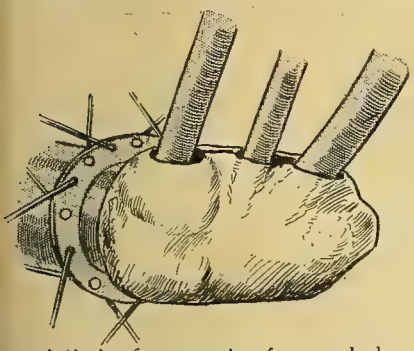
MANY machines do not permit of the use of knee-grips, owing to the fact that the gear lever or some other necessary but unwieldy article of adornment comes in the way. The consequence is that if one wears tarpaulin leggings or any other stiff overalls the enamel is very soon rubbed from the saddle end of the tank, which detracts considerably from the smartness of the machine.

Personally, I gave up knee-grips long ago for anything but the overhead valve type of solo 'bus, and use, instead, a leather jacket which covers the knee-grip end of the tank. The cover is made of good quality black leather, capable of taking a burnish, and really adds very considerably to the aristocratic appearance of the machine.

The illustrations show how the jacket is made, and, if one does not feel equal to the task of making it, almost any local cobbler will undertake the work to measurement.

A Convenient Pocket.

The small pocket is very useful for carrying a baby King Dick spanner or any other small fry in the way of kit, but, in addition to the bag, I have a loop into which fits a celluloid oilcan of the tubular variety having a screw-on safety cap, and thus I have everything instantly accessible for roadside adjustment. I have tried snap clips and various other fastenings for the bag, but find that a blunt brass hook and a stout elastic band serve the purpose better

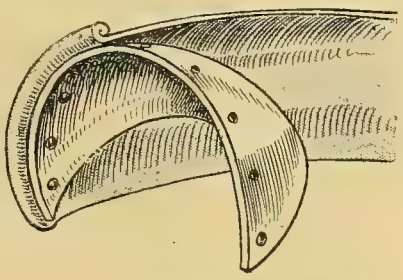


A device for protecting from mud the moving parts of certain spring forks and wheel bearings.

than any of them. This cover is further useful in that it prevents water blowing back along the tank and on to the legs of the rider.

A Mudguarding Hint.

Given a fast machine and a wet road one is fairly sure to experience the nuisance of mud blowing back from the forward tip of the front mudguard and smothering the fo'c'sle end of the tank, to say nothing of the knees of the rider. This was so bad in the case of the Henderson I am now riding that I devised all manner of shields to intercept the deluge, but finally came across a means to stop the flood at its source. A strip of leather was cut out roughly to the inside curvature of the guard in the shape shown in the sketch, and this strip was then secured inside the guard at the extreme end, so as to form an open pocket, as it were, to the splash rising from the tyre, and so conduct it back. The flap should be made of fairly stiff leather, and it will be found that, when bolted into position with short $\frac{3}{16}$in. bolts, it will naturally assume the desired shape. The end of the mudguard now keeps perfectly dry, even though the machine be ridden at high speed over torrential roads. The flap should comfortably clear the tyre.

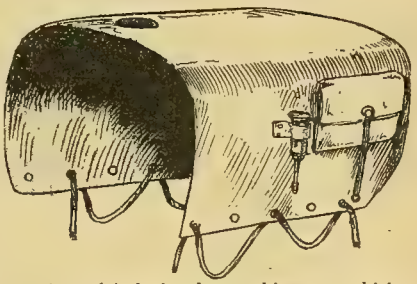


The forward end of a front mudguard in section, showing how the leather flap is inserted.

Enclosing Working Parts.

The following tip may be useful to riders of such machines as the P. and M. and various Americans, the front springing system of which involves the use of moving shackles adjacent to the front wheel spindle. The joints of these shackles should be kept well lubricated or they are apt to wear, with resultant slackness, which does not improve the steering on grease.

It is thoroughly worth while enclosing these parts with a simple leather shield, attached with copper wire, and, if the work is neatly done, it is far less unsightly than the oily mess which inevitably results from trying to keep the bearings properly lubricated. I have enclosed the forks of my P. and M. as shown in the sketch, and now, since the whole lot is out of sight, I keep everything amply lubricated, and the joints remain perfectly clean under the flap. A single charge of lubricant seems, indeed, to



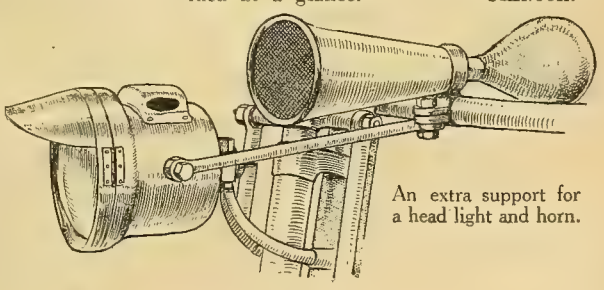
A useful device for machines on which knee grips cannot be fitted successfully owing to the position of the gear change lever.

last indefinitely, and relubrication necessitates only lifting the flap. Any old bit of leather will do, but to make the job look really finished, and to render the leather waterproof, it should be given a coat of ordinary black enamel of the kind most motor cyclists keep.

A Stabiliser for Lamp and Horn.

The following tip is, I suppose, more or less obvious, yet very few seem to adopt it. Horns have a way of slipping round the handle-bars during prolonged runs at speed, while head lamps are apt to vibrate, which eventually shakes their lenses loose and causes an eternal rattle—or, worse still, is very apt to cause the bracket to fatigue and finally break. This refers, of course, to machines fitted with steering head brackets really designed to carry a lamp.

Both misfortunes can at once be remedied by getting the village blacksmith to hammer out a rod of the correct length to interconnect the two. The rod will, of course, have eyes at both ends, one looking upwards and the other crosswise, and, if desired, the work can be nickelled, though black enamel is really good enough. The sketch illustrates the idea at a glance. — CHINOOK.

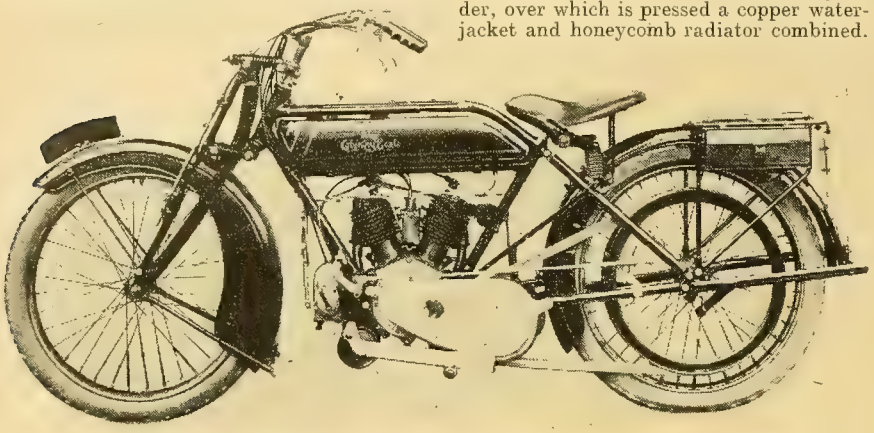


An extra support for a head light and horn.

OUTSIDE OLYMPIA.

NEW MACHINES OF INTEREST SEEN OUTSIDE THE SHOW.

OLYMPIA is not sufficiently large to accommodate all those who desired to display their wares in its spacious hall, consequently not a few items of interest were to be seen in the Hammersmith Road and the surrounding district.

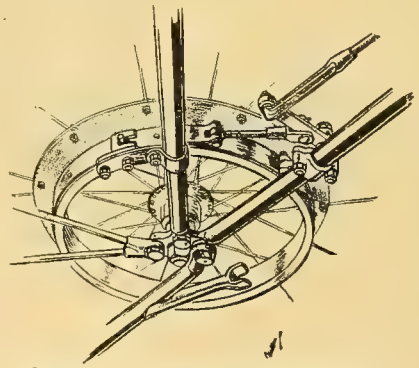


A twin Coventry Eagle, embodying the well-known 5-6 h.p. J.A.P. engine and Sturmey-Archer gear.

The best known exhibit was that of the Coventry Eagle Motor Co., which was well worth an inspection. A wide range of models was shown. The 5-6 h.p. J.A.P.-engined sidecar outfit, fitted with a Sturmey-Archer gear box and chain-cum-belt drive, is an excellent machine following standard lines throughout, but possessing one or two special features. Both brakes are on the rear wheel, that on the off side being of the external contracting pattern provided with a right and left-hand thread adjustment on the brake rod. The other brake consists of a Fibrax-lined aluminium shoe situated on the near side of the machine, and acting on a dummy belt rim. The handle-bars are covered with Bluemel's celluloid. Aluminium footboards are provided, with rubber rests at their forward ends. Quite an attractive model is the 3½ h.p. Abingdon-engined Sports model, which is provided with a Sturmey-Archer three-speed gear, kick-starter and clutch, Lucas Magdyno, and disc wheels. A similar machine, fitted with the same engine, 85×88 mm. (499 c.c.), is fitted with the new pattern brake, and has a sidecar attached to it. Among the lightweights we noticed a 2¾ h.p. J.A.P.-engined model with a two-speed Sturmey-Archer gear box, a Mark VI. Villiers engine two-stroke with an Albion gear box not incorporating clutch and kick-starter, and a 2¾ h.p. J.A.P.-engined Coventry Eagle fitted with the company's new spring frame.

A Water-cooled Single.

An important motor bicycle, which we are very glad to see revived after the war, is the 3½ h.p. Green. Our readers may remember that the Green engine is one of the lightest and most successful water-cooled engines ever fitted to a motor cycle. Water-cooling undoubtedly possesses many attractions; when it is fitted it is more easy to keep the engine in tune and more easy to maintain full power on full throttle. The Green engine possesses a cast iron cylinder, over which is pressed a copper water-jacket and honeycomb radiator combined.



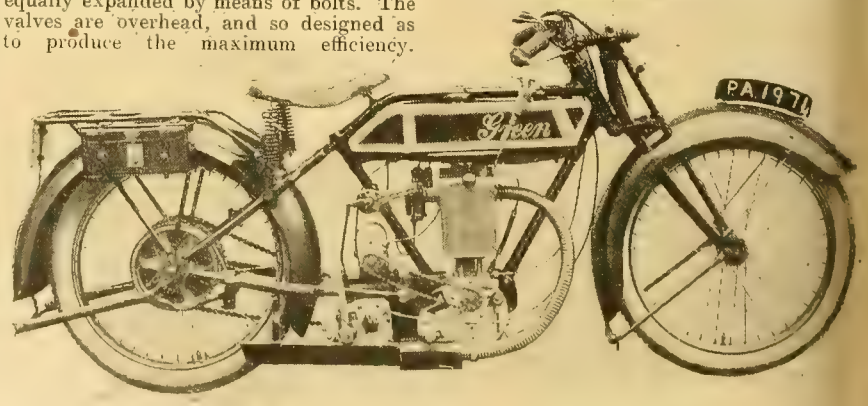
Contracting brake of the Coventry Eagle.

This jacket is secured at the top by means of a castellated ring nut, while at the base of the jacket is Green's patent watertight joint, consisting of a rubber ring between two brass rings equally expanded by means of bolts. The valves are overhead, and so designed as to produce the maximum efficiency. These excellent features remain unaltered; but, so far as the engine itself is concerned, the chief improvements lie in the fitting of ball and roller bearings to the connecting rod and crankshaft. The piston is of steel, and of the Zephyr pattern. The amount of water carried in the jacket and radiator is not quite sufficient for ordinary purposes, and in the very wide tank a separate brass water compartment, with a capacity of 1½ pint, has been let in, and between it and the oil compartment an air space has been provided. The tank is secured underneath, and the secondary horizontal frame member is in duplicate, and splayed out so as to allow the valves and the cylinder head to be easily reached. The frame has been entirely reconstructed, and is now built to accommodate a Sturmey-Archer three-speed gear box and 7½in. mudguards. Two external contracting band brakes are fitted to the rear wheel, in which also is incorporated the transmission shock absorber. This machine is shortly to be ready for production, and deliveries will, we understand, begin in March. The makers are the Green Motor Cycle Co., 50, Jermyn Street, London, W.1.

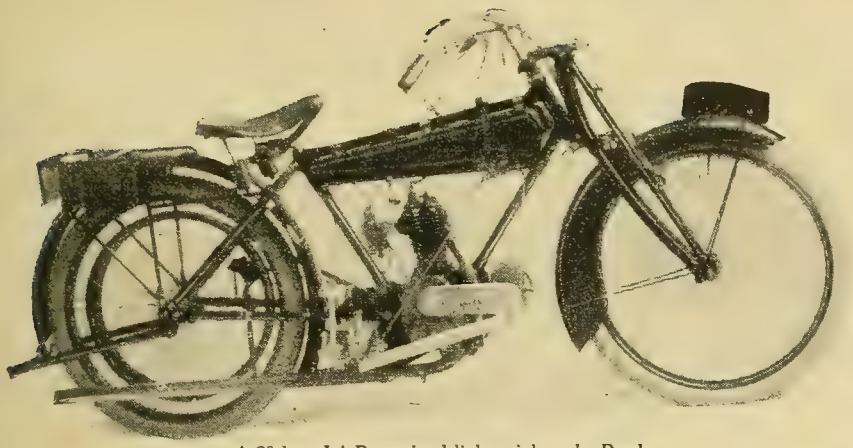
The Pullin Position.

In the same building there was also to be found the interesting Pullin motor cycle, which was dealt with in very full detail in *The Motor Cycle* of March 25th, 1920. Unfortunately, so far as production is concerned, it is no further advanced than it was at that date, but Mr. Pullin informed us that he hoped very shortly to announce that the manufacture of this interesting machine was already in progress. The Pullin motor cycle is handled by the Pullin-Groom Motor Cycle Co., Ltd., 24, Buckingham Gate, London, S.W.1. The new Martin motor cycle is also to be seen here.

Another motor cycle which was on view in the same house was the Ready-Jap. It is an attractive little machine built by Messrs. D. Read and Co., Weston-super-Mare. The frame is composed of straight tubes throughout. It is fitted with a 2¾ h.p. J.A.P. engine and the best components, and its price



Re-appearance of the water-cooled Green engine. It has a radiator embodied with the cylinder.



A 2¾ h.p. J.A.P.-engined lightweight—the Ready.

cipal feature consists of a concealed silencer in the end of the long exhaust pipe. This consists merely of two drilled cones, of which the apex faces forward, connected by means of a rod. It is held in position by a grub screw.

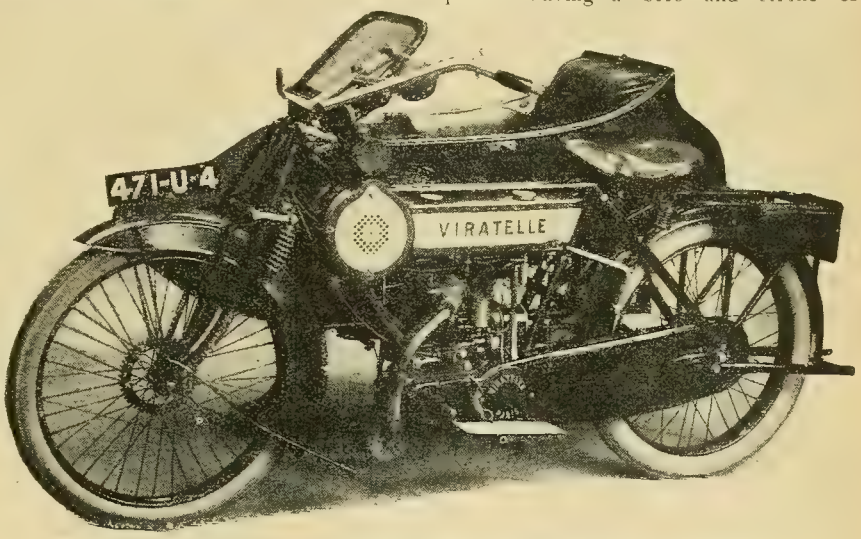
A Miniature Runabout.

Quite the cheapest three-wheeler in the neighbourhood of Olympia was the Cambro, made by the Central Aircraft Company, Ltd., Kilburn. The motive power, which was formerly known as the Johnson motor wheel, and now known as the Economic motor attachment, is situated over the rear wheel. It is single geared, and is fitted with a starting arrangement consisting of a pedal connected to the free wheel on the rear spindle. By actuating this pedal the whole machine is pushed forward, and the engine is started by this means. Both front and rear portions are sprung on rubber shock absorbers, such as are used on aeroplane landing gear.

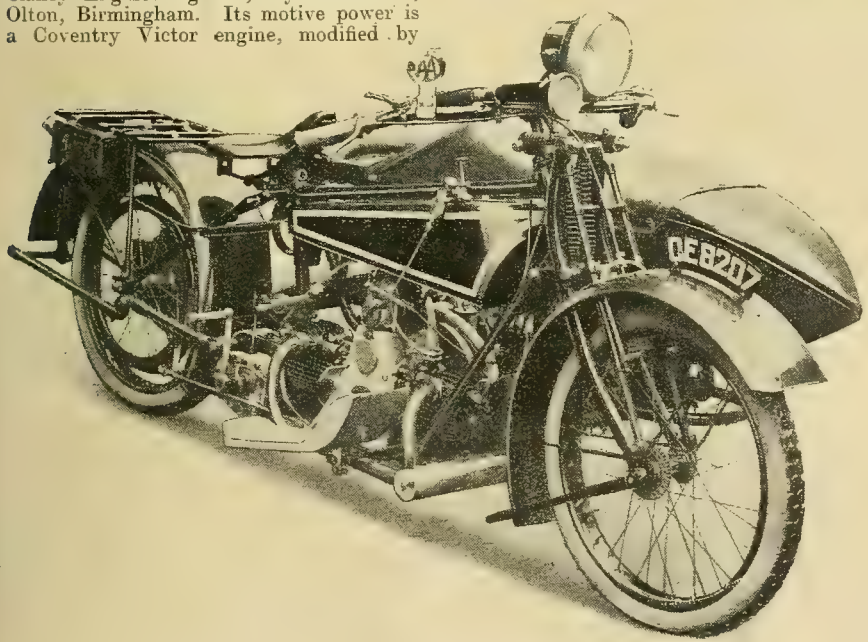
A machine which is built of standard components, is the Slaney, sold by the Slaney Engineering Co., Kyneton Road, Olton, Birmingham. Its motive power is a Coventry Victor engine, modified by the company so as to get a better chain clearance by moving the carburetter on to the near side, and placing the exhaust pipes on the off side. The exhaust pipes lead into a long narrow expansion chamber running across the width of the vehicle, and in front of the footboard, from which there is an exit pipe on the near side. Other special features are the finger nut adjustment of the external expanding foot brake on the offside, a very large tank, wide mudguards, and the specially strengthened luggage carrier.

An Engine Unit.

An excellently-made two-stroke engine was to be seen at Messrs. Burts Motors, 245, Hammersmith Road. This is the M. and B., made by Messrs. John Morris, Mill Lane, Knowle, near Birmingham. The engine is the ordinary three-port pattern having a bore and stroke of



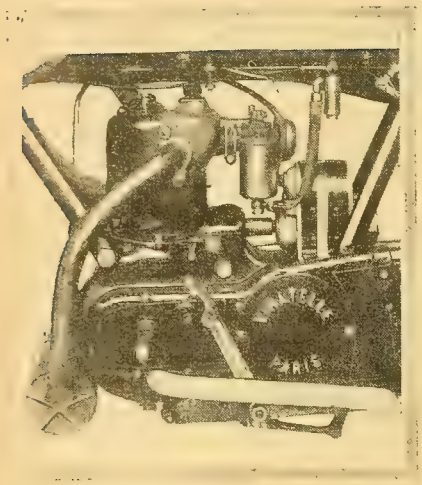
French Viratelle water-cooled two-cylinder outfit. Observe the peculiar radiators on the front end of the tank.



A big flat-twin Slaney, with a Coventry Victor enengine.

67×70 mm., and a c.c. of 246. The cylinder is very carefully bored so as to get even thickness of metal throughout, is then left to season for two months, and then ground. The piston is treated in very much the same way. The main shafts, of high quality steel, are hardened and ground, and run in bushes of large dimensions, composed of chilled cast phosphor bronze. Hoffmann roller bearings are employed in the big ends. The lubrication has been carefully thought out. Oil enters a single union and feeds through a port directly under the exhaust port to a groove round the piston with which it comes into line at the bottom of its stroke. Oil is then directed downward through internal oilways by a positive feed to the main bearings. The gudgeon pin is provided with oilways, and has a central groove cut in it, so that no matter what position the pin, oil has free access to the oilways.

At the same depot several models of the French-made Viratelle were to be seen. No one can accuse this machine of being out of date. It is a machine which has been thoroughly thought out from stem to stern. The single-cylinder has a bore and stroke of 73×82 mm. (350 c.c.). Both valves are enclosed, and



Engine and gear unit of the Viratelle.

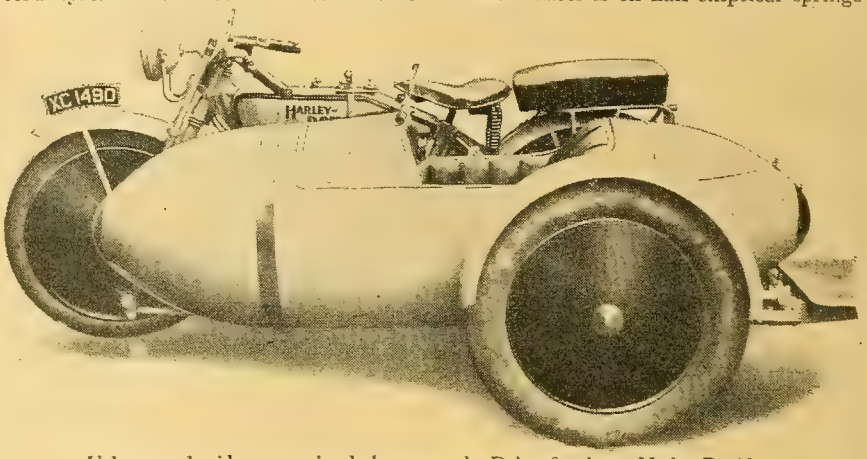
are situated at the rear, while the whole of the transmission is entirely protected. Behind the engine is a three-speed epicyclic gear box. The gears are selected by a lever on the handle-bars, while the clutch is engaged either by the pedal provided or by the handle-bar lever. Water-cooling is arranged on the thermo-syphon principle, the radiator being carried behind the front forks. Between each portion of the radiator is a fan driven by means of a flexible shaft from the magneto drive. The forks are not without interest, as they are hinged at the fork crown, and are provided with laminated springs which act both as fork springs and as girders. Knock-out spindles are provided to each of the wheels, and a spring seat-pillar and sprung footrests form part of the equipment. Control wires pass through the handle-bar tubes, which are finished in black. A similar machine was also shown to us which was fitted with a two-cylinder engine with the cylinders arranged side by side.

Several sidecars were to be seen outside the building. Among these we may mention the Delta, now known as the Volta, which was described in detail in the issue of June 3rd, 1920.

Car Type Tyres.

One of these machines was shown fitted with a 750×135 mm. oversize Palmer cord tyre. The sidecar is best known for its luxuriously fitted and elaborately equipped projectile-shaped body. Such a tyre as that referred to is practically unwearable, and greatly increases the comfort of the passenger. The Volta sidecar is sold by the Volta Sidecar and Accessories Co., 23, Westworth Road, Manor Park, London, E.12.

For those who fancy a two-seated sidecar the Art should be of special interest. It is manufactured by the Sandham Engineering Co., Ltd., and is sold by the Art Motor Cycle and Sidecar Co., 18, Walbrook, London, E.C. The body is most roomy, is provided with a comfortable hood and screen, and in future models the former will be designed to fasten down on to the latter, thus doing away with the necessity of straps. The body is hung on threequarter-elliptical car-type springs, while the sidecar wheel is on half-elliptical springs provided with long shackles which are hinged together. Strength for the sidecar axle is obtained by having this composed of three tubes instead of one single one. A load of up to forty stone may be carried.



Volta torpedo sidecar, previously known as the Delta, fitted to a Harley-Davidson.

Lightweight Records Broken.

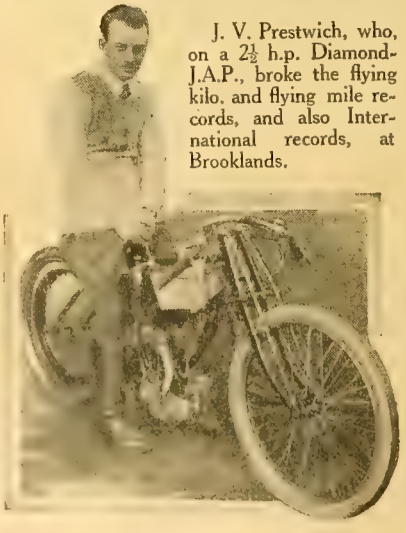
Two-stroke and Four-stroke Successes. A Two-stroke beats the Flying Kilo. Record.

NO doubt in the effort to secure effective Show advertising, records in the lightweight classes were broken with bewildering rapidity during last week.

First came J. V. Prestwich, who, mounted on a side-by-side valve J.A.P.-engined Diamond, made several alterations to the Class A (250 c.c.) figures on November 23rd. On November 25th the same rider again made an attack, and succeeded in raising all the 250 c.c. and 275 c.c. up to fifty miles another notch, while on the 29th (the opening day of the Show) he made new figures in the same classes for all distances and times up to 250 miles and six hours respectively.

As an instance of the way in which the Diamond-Jap maintained its tune, reference to the tabulated results below will show that the speed during the sixth hour was greater than that attained during the two hours immediately preceding.

Excellent as was the speed over the flying kilometre, the record established on November 23rd was destined to be short lived, for on December 1st D. R. O'Donovan, past master of extracting speed from whatever he rides, brought out the hush model 63×80 mm. (249 c.c.) Velocette, and proceeded to add an extra 3 m.p.h. to the flying kilometre speed. The performance is a remarkable one and is really epoch-making, in so far that it is the first two-stroke machine to break a short distance ultra high-speed record, although a machine with this type of engine has already made a successful onslaught on the long distance figures.



J. V. Prestwich, who, on a 2½ h.p. Diamond-J.A.P., broke the flying kilo. and flying mile records, and also International records, at Brooklands.

November 23rd, 1920.—J. V. PRESTWICH (2½ Diamond-Jap), Class A. (250 c.c.): Flying kilom., 35s. = 63.91 m.p.h.; flying mile, 56.6s. = 63.60 m.p.h. International Mean Record, Class A.—Flying kilom. 60.13 m.p.h.; flying mile, 62.39 m.p.h.

November 25th, 1920.—Class A. (250 c.c.): 5 miles, 5m. 3s. = 59.4 m.p.h.; 10 miles, 10m. 17⅗s. = 58.3 m.p.h.; 50 miles, 53m. 45s. = 55.81 m.p.h.; 1 hour, 55ml. 961yd. (55.55 m.p.h.).

Class A1 (275 c.c.): 10 miles, 50 miles, and 1 hour as above.

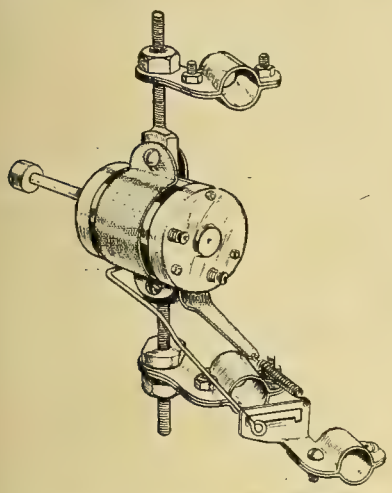
November 29th, 1920.—Classes A. (250 c.c.) and A.1 (275 c.c.): 100 miles, 1h. 50m. 39⅘s. = 54.22 m.p.h.; 150 miles, 3h. 0m. 48s. = 49.75 m.p.h.; 200 miles, 4h. 18m 35s. = 46.46 m.p.h.; 250 miles, 5h. 18m. 58⅕s. = 47.02 m.p.h.; 2 hours, 107ml. 1,442yd. = 53.01 m.p.h.; 3 hours, 149ml. 474yd. = 49.75 m.p.h.; 4 hours, 188ml. 263yd. = 47.03 m.p.h.; 5 hours, 234ml. 617yd. = 46.87 m.p.h. 6 hours, 283ml. 782yd. = 47.24 m.p.h.

December 1st, 1920.—D. R. O'DONOVAN (2½ Velocette), Classes A. and A.1: Flying kilom., 33.4s. = 66.97 m.p.h.

Illustrated Review of Useful Equipment for Motor Cycles.

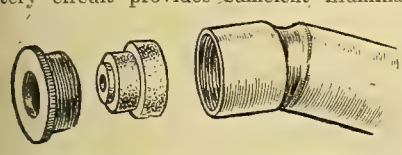
A.C. Sparking Plug, Ltd., London, S.W.7.—Various patterns of sparking plugs suitable for every type of engine.

Alterna Cycle Light Co., 89, Farringdon Street, London, E.C.4.—In a very small and compact dynamo lighting set produced by this concern, the dynamo itself is of the circular type with six stationary coils and a central rotor. The driving arrangement is by means of a friction wheel working on the tyre of the

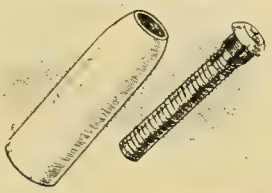


Friction drive from the tyre is employed with the Alterna dynamo for lightweights. The brackets carry it between the top and bottom rear frame stays.

back wheel, the dynamo being carried on a special bridge between the top and bottom back stays. A dry battery is also provided, since the current generated is alternating, and therefore unsuitable for accumulator charging. The head lamp is of rather unusual construction, since the bulb is carried on an arm and faces backwards towards the reflector. This arrangement gives an absolutely non-dazzling beam. While standing a small bulb connected with the dry battery circuit provides sufficient illumination to comply with the law. The Automatic sparking plug is another feature which was shown, its chief claim to



Loose connections are eliminated from the Burn Easy-Fix inflator, which pushes directly on to the valve. It was exhibited by Timson Bros.

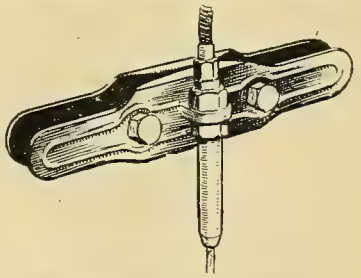


Made from French "75" shells, the Alterna electric heater is here shown dismantled.

notice being the movable points on the central electrode. It is stated that these vary their position at each explosion, and consequently never become affected by excessive carbon deposit. Another device which was shown is not only interesting on account of its utility, but also for the fact that it is a souvenir of other days. It is known as the "75" sidecar heater, and consists of a French 75 mm. shell with an internal resistance which is connected by a bayonet plug to an electric lighting circuit.

Best and Lloyd, Ltd., Cambray Works, Handsworth, Birmingham.—The Best semi-automatic drip feed is, of course, so well known that it is scarcely necessary to make any comment regarding it, and it suffices to say that it may be obtained in every possible form for motor cycle and light car lubrication. The Best mechanical oil pump, however, which is driven from the timing gear of the engine, and which works in conjunction with the semi-automatic drip feed, is not quite such a familiar component, although it has had considerable testing over the last twelve months. From actual experience, however, on one or two machines, we can say that it entirely fulfils the requirements desirable in a mechanical lubricator, since the supply of oil which it delivers can be varied as required either separately or in conjunction with the control of the throttle.

Bowden Brake Co., Ltd., Tyseley, Birmingham.—In addition to the already familiar lines connected with motor cycle brakework and control, the Bowden Brake Co. is making a special type of front brake, which is to be known as the Replacement pattern. This is specially suitable for old machines which are not provided with front brakes, and which in many cases must be so fitted to comply with legal requirements. The special feature is that a simple form of crossbridge to carry the adjustable Bowden wire stop is provided, and this is clamped to the front fork girders in any convenient position. A new and very attractive shape of handle-bar with inverted lever controls is also made. It

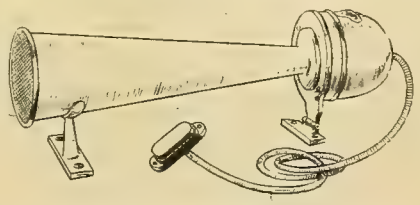


Stop bracket of the new Bowden replacement brake.

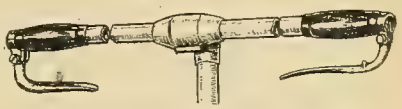
is of the straight pattern with slightly inclined and dropped grips.

Bowden Wire, Ltd., Victoria Road, Willesden, London.—Many novelties are being introduced in the control-operating mechanisms of this concern. Some of these have already been dealt with in *The Motor Cycle*, notably the Master Control, which by very simple means allows for interconnection and independent action of a combined hand and foot operation of clutches or throttles. Several types of front wheel brakes of the belt rim pattern are also being introduced for 1921 machines, and these provide a much more satisfactory method of braking than any of the rim types, but the latter are still produced.

Brampton Bros., Ltd., Oliver Street Works, Birmingham.—As well as motor cycle chains and front forks, both of

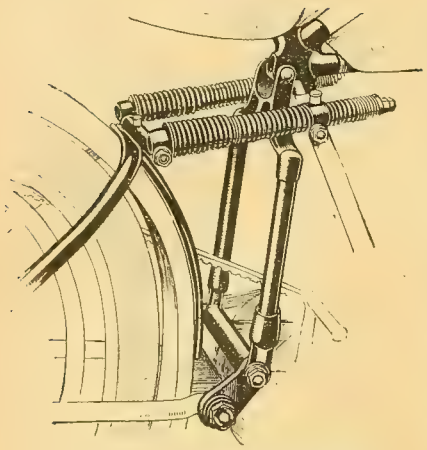


An Apollo horn suitable for the front panel of a sidecar.



An improved stem lug with outlet for internal cables is incorporated in the Bowden Brake Co.'s handle-bar.

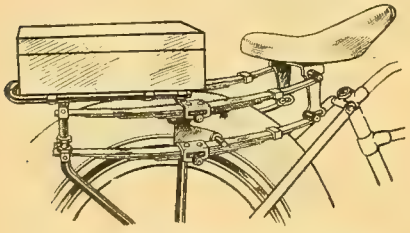
Accessories at Olympia.—



A Brampton spring frame unit for fitting to any standard type of lightweight frame.

which are equally well known, a new spring frame is being offered. It consists of stays hinged behind the gear box bracket and connected to the rest of the machine through the top stays by a system of coil springs similar to that employed for the top links of the front forks.

J. B. Brooks and Co., Ltd., Great Charles Street, Birmingham.—Brooks saddles enjoy a reputation as regards quality which may truly be described as unequalled, but the makers are determined not to rest on their laurels, and

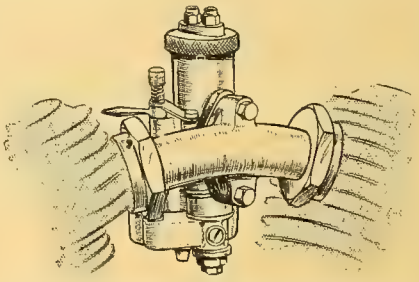


Brooks's cantilever saddle and a carrier case by the same makers.

have therefore produced an entirely new type of saddle suspension. This consists of four laminated cantilever springs pivoted at their centres upon the front stay of the standard motor cycle carrier. The forward extremities of the springs (two at each side) carry a pan seat leather topped on two vertical links, while the rearmost ends of the springs are free to slide under a pair of adjustable rollers, by means of which the tension on the springs may be altered to suit the rider's weight. The saddle has practically a vertical motion, and, owing to the length of the springs used, the rider may truly be said to float when carried on this type of seat. Many machines shown at Olympia were equipped with this new form of Brooks saddle, which is bound further to enhance the high reputation of those responsible for its production.

Brown and Barlow, Ltd., Carburet Works, Witton, Birmingham.—Carburetters for all kinds of engines are the standard production of Messrs. Brown and Barlow, Ltd., whose name stands for all that is good in this particular component part. There are very few changes in the standard variable jet and two-stroke types, but a detail improvement has been effected in the method of operating the pilot jet which is of special service for easy starting on V twin engines. On former models, if the driver omitted to cut out the easy starting device when the engine was running, it not only interfered with the carburation but caused the consumption to be excessive. The new arrangement, even if forgotten, will not seriously affect the running. An improved form of induction pipe for V twin engines is also being introduced. This consists of a very short pipe between the cylinders with a flange fixing for the carburetter. By this arrangement the latter is brought into a very unobtrusive position between the cylinders, where it is protected from draughts of cold air and obtains the maximum benefit from conducted heat.

C. L. and H. Burton, Bernard Street, Walsall.—Burton sparking plugs have

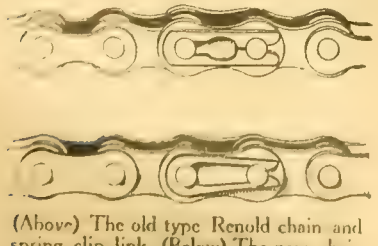


Short induction pipe and flange fixing for B. & B. V-twin carburetter, showing also the new easy starting control.

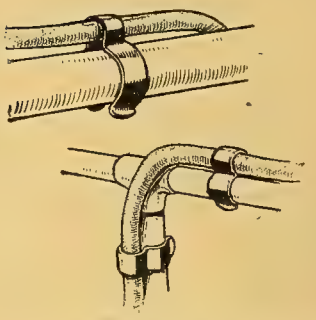
continually proved their efficiency in all types of engines, and it has not been found necessary to make any alteration to the standard three-point model with detachable steatite insulator. Many variations are made to suit different engines, such as those which necessitate a long reach or have a special thread. A new single-point model is also being produced as a competitive line; this also has a detachable insulator.

College Leather Co., Castle Street, Northampton.—The College mudshield is, of course, well known, for it has been on the market for eleven years. Covering the lower part of the engine, as well as the rider's legs up to the level of the tank, the shield may be used in conjunction with an apron, which provides the maximum weather protection possible on a solo machine. Other products include a number of becoming soft leather "tams" for lady motor cyclists.

Cooper Stewart Eng. Co., Ltd., 11, Broad Street, Bloomsbury, London, W.C.2. For those who favour the magnetic type of speedometer, which, of course, has decided advantages in many respects, the Stewart instrument may be regarded with interest. One of its special features is the absence of complicated mechanism. In addition to the speedometers, the firm produce a variety of practical mechanical horns.



(Above) The old type Renold chain and spring clip link. (Below) The new chain of double strength, with the new clip which cannot be thrown off at any speed.

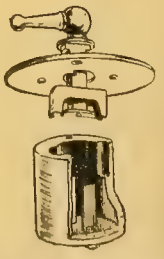


J.A.R. clips for acetylene tubing; there are two varieties to fit frame tubes and carrier tubes.

Cowey Engineering Co., Ltd., Kew Gardens, Surrey.—Cowey speedometers are made for all classes of motor cycle, and have been improved in details, a remarkably clean appearance having been attained. The same remark also applies to the Cowey horn, which is certainly in the front rank on account of its weatherproof construction and reliable mechanism.

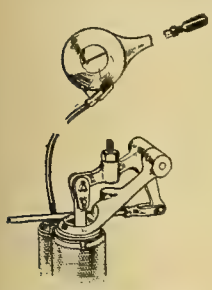
Cox Carburetters, Ltd., Lower Essex Street, Birmingham.—Automatic carburation is one of those subjects which form a never failing source of discussion amongst motor cyclists, and the Cox-Atmos carburetter, by reason of its simplicity, has created special interest. A new type of float chamber has been designed, and this includes an inner shell having gauze-covered apertures, so that no grit or water can pass through to the jet itself. Top feed has now been adopted.

G. Davenport and Co., Ltd., Clerkenwell Road, London, E.C.1.—A departure from the usual type of speedometer construction was shown on this stand, which has several features of interest. It is known as the Robinson, and carries a guarantee for 10,000 miles, this being made possible by the fact that it is constructed entirely by highly skilled instrument makers. The speed indication is controlled by a centrifugal governor, but



A high-tension terminal and an electrical switch made by the makers of Cooke's plugs.

Accessories at Olympia.—



A Binks carburetter arranged for twist grip control. An extra air lever is provided.

the trip recorder (and the total mileage recorder under the first 100 miles) is shown on a circular scale by two pointers coloured white and red respectively. The trip is instantly reset by a brass plunger knob in the centre of the dial.

Also shown by this firm was the Pettitts safety filler, which is carried in a neat leather case, which also accommodates a very useful spanner for all sizes of sparking plugs and petrol can stoppers.

DEGORY NO JET CARBURATOR CO., 93, Moore Park Road, S.W.6.—Amongst one lever automatic carburetters, the Degory No Jet is rapidly coming into a leading position, since it is proving to be exceptionally economical in use. Many of our readers have testified to its excellent qualities in this direction, and almost phenomenal mileages are claimed for it with various types of engines. It is particularly neat in appearance, and has a minimum number of parts, while the method of attaching the float chamber to the throttle barrel allows it to be used in any position.

EAST LONDON RUBBER CO., 29-33, Great Eastern Street, E.C.2.—This concern is chiefly devoted to supplying all the demands of the retail trade, but a number of specialist lines are carried. Amongst these may be mentioned the Flexifork, a new type of front fork, which combines a vertical action controlled by coil springs with a radial action limited by a leaf spring; the E.L.I. spring seat-pillar, which is one of the many varieties of auxiliary saddle suspension introduced this year; and the Warner front forks and rear spring frame attachment. The latter is a simple form of spring frame having subsidiary top stays, which are connected to floating links carrying the wheel spindle, and pivoted at the rear fork-end. This device may be fitted to almost any standard pattern motor cycle frame with very little structural alteration.

Sterling leg-guards exhibited by Brown Bros., Ltd.

E.I.C. MAGNETOS, LTD., Sampson Road North, Birmingham. — As the standard ignition unit on a number of first rank machines, the E.I.C. magneto is unaltered, since the reliability of its design is unquestioned.

FORWARD SPARKING PLUG CO., 35, Summer Row, Birmingham.—A large variety of sparking plugs are manufactured by the Forward Sparking Plug Co., and all of them have proved their worth by long service in the hands of the public. A new model introduced this year is the Aero type, which has air-cooling flanges round the body. There is one central electrode, and the insulation is of the detachable mica variety. A number of other accessories are produced, and amongst these may be mentioned the

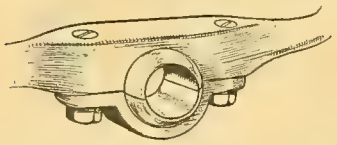
Accessories at Olympia.—

valve stem adjusting cups for engines with non-adjustable tappets, the well-known Forward belt fasteners, and the new type of endless leather link belt, which varies from all other belts of this type in having all the connecting link bearings of metal.

A. H. HUNT, LTD., Tunstall Road, Croydon.—Electric lighting equipment

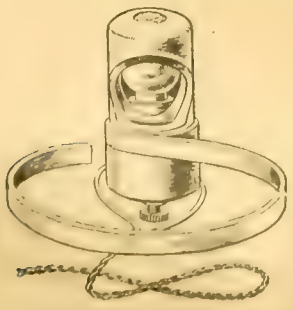


Ball and socket clamp of the Hunt electric head lamp and accumulator bracket.

using dry batteries or accumulators is the speciality of this firm, and amongst their new products may be specially mentioned the new Pleteset. This consists of a very efficient head lamp (carrying a six-volt bulb) mounted on a bracket which also supports a cast aluminium battery box. The bracket is adaptable for fitting to almost any type of handle-bar, since it makes use of a ball and socket clip of

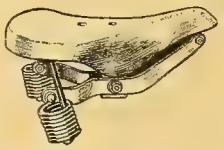
Details of the switch on Hunt battery lighting set.

extremely simple design. Included in the top of the battery case is a positive screw switch, which connects up the three-cell block type accumulator as required. The whole fitting is exceedingly well designed, and has a decidedly handsome appearance, and may be secured to any pattern handle-bar. Amongst other items produced by this firm is a neat and simple speedometer lamp, which clips around the body of the instrument. The bulb in this is tinted green, in order to eliminate any glare. In addition to the above-mentioned lamp, cheaper varieties, more suitable for lightweight machines, are produced, while every style of dry battery side and tail lamps is available, in addition to route card holders, spring lamp brackets, and a neat lock for motor cycles which is combined with two spanners and tyre levers. For use in the garage as an inspection lamp, there is a very convenient arrangement of a Hellesen dry battery with a holder which carries a small bulb in a large diameter reflector.



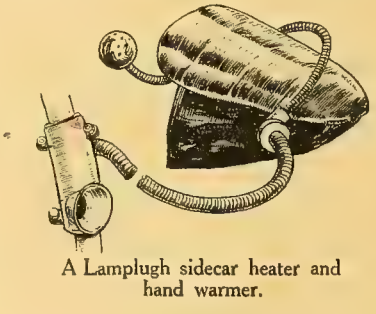
Hunt's speedometer lamp.

JELLEY'S SADDLE CO., Coventry.—An unusual type of motor cycle saddle having many claims to notice. Instead of a leather top a moulded flexible seat is used, and this has the property of conforming to the shape most comfortable to the rider. We can speak from experience of the comfort provided by this arrangement. Minor points connected with the saddle are that it has no rivets in the top; moreover, the rubber construction is waterproof, and the saddle does not suffer if the machine is left out in the rain for a length of time.



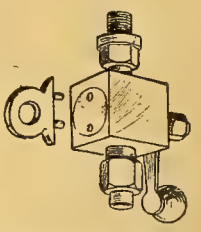
Jelley's padded flexible waterproof saddle top.

KERSLAKE, LTD., London, S.W.15.—To the motor cyclist the most interesting item amongst this firm's productions is a "sensitive" control for carburetters. This consists of a trigger secured beneath the regular control levers, and the actuation of the former opens the throttle without altering the setting of the latter. The effect is that of a sensitive finger-controlled accelerator.



A Lamplugh sidecar heater and hand warmer.

S. A. LAMPLUGH, LTD., King's Road, Tyseley, Birmingham.—A number of novelties are being introduced by this firm of specialists in motor cycle brass fittings. Probably the one of most seasonable interest is the Lamplugh sidecar heater; this is a very simple arrangement whereby warm air is passed from a box encircling the exhaust pipe and connected by a tube to a muff in the toe of the sidecar. An extension from the latter terminates in a perforated metal ball which can be used as a hand warmer. It will be noted that no exhaust gas is passed into the warmer, and the connecting tube may be detached in a moment if the heat is not required. In view of the fact that thefts of motor cycles are now very prevalent, the Ace petrol tap lock is worthy of notice. This is a petrol tap of somewhat larger proportions than the average, which is self-locking in the off position. It can only be reopened by the insertion of a special plunger key which engages with two holes provided in the back of the tap. Only when the key is pressed in may the tap be opened. Amongst other productions are a very easily operated quickly detachable filler cap and a two-level tap combined with a filter.



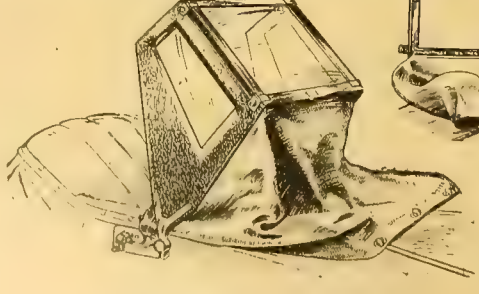
Lamplugh's Ace petrol tap lock; the petrol can only be turned on when the key is inserted.

LEO RIPAULT, LTD., 1, King's Road, N.W.1.—Oleo plugs in various models are the chief speciality of this firm. The construction is simple and very compact, electrodes of the single point and cross-bar type being used; the insulators are detachable, and are either of mica or porcelain. There is also a new model plug having a non-detachable mica insulator and a single central electrode. Probably this is one of the smallest sparking plugs made for motor cycle use, and it follows the general lines of those which were used successfully on rotary aircraft engines.

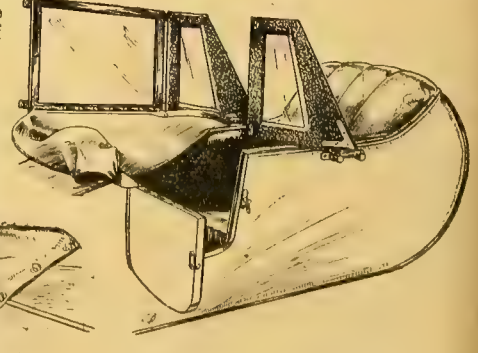
LLOYD MOTOR CO., LTD., 132, Monument Road, Birmingham.—A saddle suspension, made familiar on the L.M.C. machines, is now offered as a separate unit for the conversion of any machine which has a top tube not covered by a saddle tank.

LYCETTS, LTD., Bromley Street, Birmingham.—Saddles, pannier bags, and a top tube toolbag are products which are all satisfactory component parts in the specifications of many well-known machines.

MARKT AND CO. (LONDON), LTD., 98-100, Clerkenwell Road, E.C.1.—Adjustable spanners, Veeder cyclometers, fly-

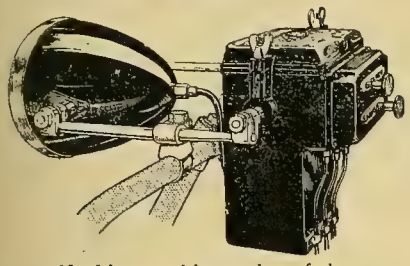


Combined windscreen, apron, and side curtains of Sandum manufacture.



A Sandum windscreen opened to admit the passenger.

Accessories at Olympia.—



Head lamp and battery box of the M-L Maglita set (lightweight model).

wheel and pulley removers, and the Johns-Manville speedometers are amongst the high-quality productions marketed by this concern.

Midland Gear Case Co., Ltd., Bridge Street West, Birmingham.—Motor cycle accessories in leather are the special products of this firm, and these include knee grips, which are adjustable to any size and shape of tank, and inner tube cases arranged to clip over a rolled-up tube on the handle-bars. Both these accessories are already well known to motor cyclists.

H. Miller and Co., Birmingham.—The special feature of Miller acetylene lamps, apart from the excellent light-giving qualities of course, is the convenient bracket which permits the set to be fitted to almost every type of handle-bar on the market. Miller dynamo lighting sets for motor cycles will shortly reach the production stage, and these include a handsome plated head lamp with a switch-box incorporated in the bracket. The batteries are carried in a box adjustable in all directions, so that when secured to the saddle tube of the machine it may remain vertical. Prolonged testing has proved that the dynamo itself is satisfactory, and the design, which was reviewed in *The Motor Cycle* twelve months ago, remains essentially unaltered. Regulation is by a magnetic arrangement, which reduces the intensity of the flux cut by the armature coils, and, in consequence, no delicate electrical appliances are required to keep down the voltage at speed.

The M-L Magneto Syndicate, Ltd., Victoria Works, Coventry.—One of the most popular combined lighting and ignition units in the Show is the product of the makers of the M-L magnetos. It was fully described in a recent issue of *The Motor Cycle*, but a further small improvement has been carried out in the head lamp. This consists of a small low-powered bulb for use when the machine is standing or when town riding. The dimming arrangement is controlled by a small knurled knob on the top of the head lamp which brings the small bulb temporarily into operation by depressing it or permanently by giving it a half turn. Of course, the automatic dimming device on the head lamp main bulb is retained; this acts as a reminder to the rider that the battery switch should be pressed in when the engine is running. The Maglita outfit is now being produced

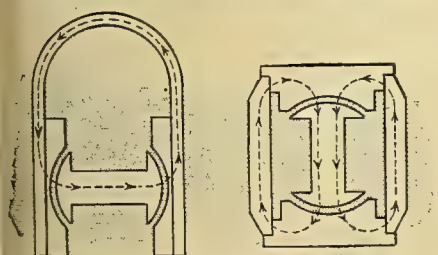


Diagram showing how the new design of M-L magneto allows a double magnetic flux to pass through the armature. It shows its compact nature in contrast with the old "horse-shoe" type.

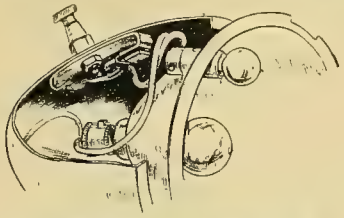
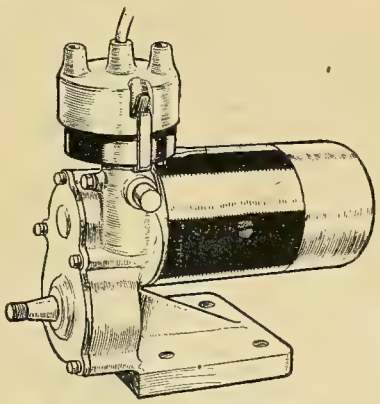


Dim and full power bulbs in the M-L Maglita large size head lamp. A push-down switch controls the latter.

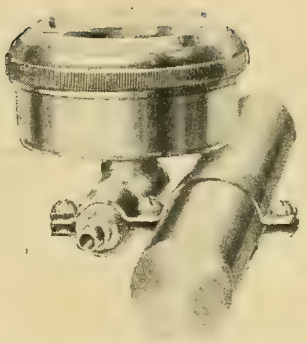
in a variety of forms suitable for light or heavyweight single-cylinder machines and for flat twins and two-strokes. The motor cycle magnetos for all types of engines remain unaltered, but a new pattern magneto, the K.V. type, is being introduced. This has decided electrical advantages which enable its external dimensions to be considerably reduced, and its appearance is exceedingly compact and workmanlike.

North and Sons, Ltd., 14, Soho Square, W.1.—A range of speedometers is produced by this firm, who, amongst other types, have made a speciality of rear-wheel-driven models. The driving arrangements are very substantial, and do not interfere with the security of the wheel spindle.



The Rotax dynamo with ignition contact breaker and distributer.

Prices' Co., Ltd., Battersea, S.W.11.—Motor cyclists do not need to be reminded of the excellence of Prices' oils, but the enquiring spirit will find much to mark and inwardly digest concerning lubrication if he obtains the various publications and pamphlets which the company offer. The advantages of purchasing small drums of oil are made clear, and a device for safely pouring out the contents of these is worth noting.



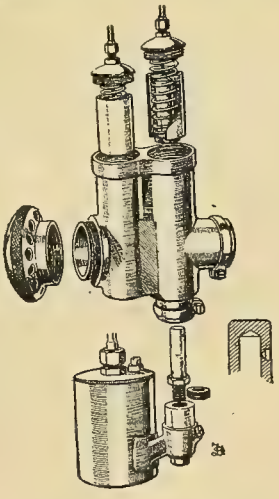
Top tube attachment for rear wheel drive of the Bonniksen speedometer.

Rotax Motor Accessories Co., Ltd., London, N.W.10.—A development of combined lighting and ignition, which may be far-reaching, is to be introduced. This consists of the Rotax dynamo arranged for providing a means of ignition by the incorporation of a contact breaker and distributer. The dynamo charges the batteries, which supply current for ignition *via* the contact breaker and a separate high-tension coil.

Rotherham and Sons, Ltd., Spon Street, Coventry.—Standard Rotherham productions are general motor cycle brass fittings, such as oil pumps, taps, cocks, unions, and gauges, but, in addition to these, are the Everest carburetters and Bonniksen speedometers. The latter have been improved in detail, especially as regards the driving arrangements.

Runbaken Magneto Co., Ltd., Manchester.—Magnetos bearing the Runbaken name have rapidly developed a reputation not only for their reliability, but also for their small dimensions, which make them specially suitable for small machines. A standard type of contact breaker is now fitted in place of that with stationary contact points which was formerly used.

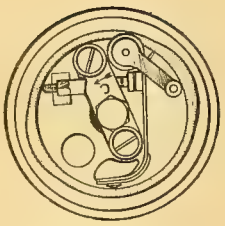
The Safety Petrol Filler Co., Ltd., Northampton.—Besides the well-known Liquall safety petrol fillers, a number of small conveniences for motor cyclists' use are made.



A carburetter produced by Rotherhams—the two-lever Everest with multiple jet.

Accessories at Olympia.—

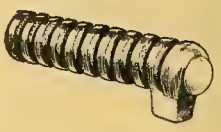
S. SMITH AND SONS (M.A.), LTD., 179-185, Great Portland Street, W.—Speedometers, mechanical horns, handle-bar watches, and similar accessories are all well-known products of this accessory firm, who specialise in fitments of the highest class. In addition to these, the K.L.G. plugs must not be forgotten, and attention must be drawn to the new G.1 type, specially commendable for its simple construction and the detachability of its insulated centre, which may be replaced at any time with a new one should it ever become defective. The body of the plug is finished by a rustproof process, which greatly adds to its appearance. Amongst other useful accessories stocked are Shock-stops, a new type of indiarubber handle-bar grip, which is specially adapted for use in conjunction with inverted lever controls, or with hook-ended grips of the ordinary type. These grips are becoming very popular.



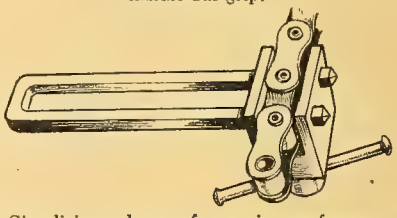
A continuous cam is now used in the contact breaker of the C.A.V. magneto.

Pettetts' "Fitall" spanner embodying two screw-drivers.

An all-rubber Roberts handle-bar grip.



A point about the new Smith "Shock Stop" handle-bar grip is that it protects the inverted lever joint.



Simplicity and ease of operation are features of the Dandy chain rivet remover handled by S. Smith & Sons (M.A.), Ltd.

VACUUM OIL CO., LTD., London, S.W.1.—Gargoyle Mobiloils, greases, and everything appertaining to the efficient lubrication of motor cycles and cycle cars. The Vacuum names are household words in motor cycledom.

C. C. WAKEFIELD AND CO., LTD., 30-32, Cheapside, E.C.2.—In addition to the brands of oil which have been standardised for many years by a number of leading makers, this firm is introducing a new variety to be known as Castrol XL. This is somewhat lighter in body than the better known Castrol C, and it has been specially blended for use under racing and competition conditions. Sidecar owners and others who purchase oil in five or ten-gallon drums should make a point of enquiring into the merits of the patent screw-in locking tap for the drums. This is specially suitable for use with the Castrol five-gallon non-returnable drums, and forms a handy method of avoiding waste when drawing off oil for use.

The B.M.C.R.C. Dinner.

FEW dinners that we have attended—and we have been present at a great many—have passed off better than the members' dinner of the British Motor Cycle Racing Club, held on Wednesday last week at the Holborn Restaurant. Nearly 170 members turned up, there were numerous guests, the speeches were as brief as possible, and the whole of the evening was devoted to enjoyment and amusement. An excellent programme had been provided, and, owing to the presence of several visitors from the Continent, the affair might almost be described as being an international one. The chair was occupied by Brigadier-General Sir Capel Holden, K.C.B., F.R.S. On his left sat Lt.-Col. F. Lindsay Lloyd, C.M.G., and among the guests we noticed M. Jules Neher (president of the Union Motocycliste Suisse), M. Fagard (president of the Union Motocycliste Belge), Mr. Paul Kelecom (of the Fabrique Nationale, Belgium), while MM. Mellane and Arnaud might be said to represent France.

Toasts.

After the toast of "The King" had been proposed by the Chairman, that of "The British Motor Cycle Racing Club" was proposed by Mr. H. T. Rutter. Mr. Rutter paid the club a great compliment, congratulating the president and officers of the club, as he said that at the many meetings he had attended he saw nothing but straight riding, few protests, and thorough sportsmanship on all sides. He evoked considerable amusement, and said that the club was an ideal means of testing a machine.

Mr. Loughborough, in a very brief reply, said that the proposer could not have praised the club in a nicer manner, and the club members could not have deserved it better. (Laughter.) He referred to our foreign guests, and made mention of several generous offers of prizes. Messrs. C. A. Vandervell and Co. had offered a ten-guinea prize for the best aggregate performance, but they had one already. This year Mr. Alec Ross, who had given a prize for the best aggregate performance by a Service member, repeated this offer for next year. Mr. H. Collier offered a ten-guinea prize for an open event; Mr. Olai offered a similar prize, while Capt. A. J. Millar offered a hundred-guinea gold cup for a hundred mile race and a two hundred-guinea gold cup for a two hundred miles race. (His idea is that long-distance races will attract the amateur, as it is not so much the speed which counts as the reliability of the machine, and consequently the private owner has almost as much chance as the expert.)

The Chairman then proceeded to distribute the numerous prizes won during 1920. Among the recipients may be mentioned W. A. Jacobs, who won the Ross Trophy; he has gained nearly all his successes on an eight-year-old Singer, and we learn now that he is putting up excellent performances on a little Metric-engined motor bicycle.

New Prizes.

Two further prizes were then announced: The Norton prize of twenty-five guineas for the best aggregate performance of a private owner, and a ten-guinea prize (presented by Mr Watson-Bourne) for a member or ex-member of the R.A.F.

Mr. T. W. Loughborough then announced that the Godfrey Cup, which, unfortunately, had not yet been engraved, had been won by H. R. Davies. This is a cup presented by Messrs. Godfreys, Ltd., in memory of the late Capt. O. C. Godfrey, for the first 350 c.c. machine to do eighty miles an hour on the track, a feat which Mr. H. R. Davies had successfully accomplished on a 2¾ h.p. A.J.S.

A Reminiscence.

The Chairman then rose, and said that, as he could not present the cup, he would like Mr. Davies to come up to the high table, and would like to shake hands with him. General Holden shook Davies warmly by the hand, and addressed a series of congratulatory remarks to him; but not a word of these could be heard owing to the deafening cheering.

Davies was then persuaded to make a speech, in which he thanked those present for their hearty reception of him, and thanked the officers of the track for their assistance.

Mr. H. Stevens was also called upon to say a few words.

Mr. Loughborough also paid a tribue to the performances of Le Vack, who had accomplished the highest speed ever made on a motor bicycle in this country.

Le Vack, who was called upon to reply, in turn paid a handsome tribute to Mr. C. B. Franklin, who is now at the Hendee Works in America.

Replying to the toast of "The President," by Mr. W. H. Wells, General Holden said it was twenty-five years since he first rode a motor bicycle (referring to his original four-cylinder). He had invited the late Mr. H. J. Swindley (of *The Autocar*) to come and see it, and he rode it and expressed himself very pleased with it, but frankly admitted that he could not understand why anybody should want to ride a motor bicycle, as pedal cycles were for pleasure and exercise. General Holden was a firm believer in the motor bicycle, and he looked to its further development. He sincerely hoped to see an all-weather machine, in which both the mechanism and the rider were fully protected.

The proceedings finished with "Old Lang Syne" and "God Save the King."

COPPEN ALLAN & Co

READING STANDARD

THE WORLD'S MASTER MOTOR CYCLE.

Solo - £184. 8-10 h.p. Twin Combination - £229.

PLUS ONE

A Single or Double-seater Sidecar at will.

Deliveries will commence positively in one month, with fittings complete for attachment to the undermentioned makes of cycles:—

Reading-Standard, Sunbeam 3½ h.p. and 8 h.p. Zenith, Enfield, Harley-Davidson, Triumph, Douglas 4 h.p., Blackburne 8 h.p. B.S.A. 4 & 6-7 h.p., Rudge 6 h.p. Henderson, Excelsior (American), British Excelsior, Indian, ACE, and others.

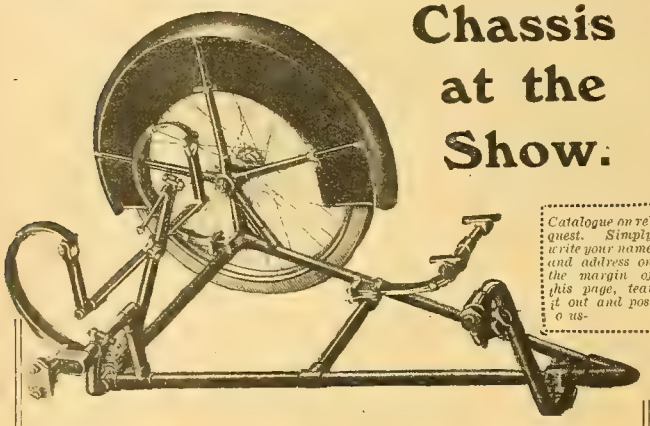
The Triangular Chassis at the Show.



Catalogue on request. Simply write your name and address on the margin of this page, tear it out and post to us.

The Olympia Show proved the following points (among others)—

One— The triangular chassis is the most up-to-date and is certainly the design of the future. Dunhills hold the original patent for this triangular chassis (No. 4784/15), and it is embodied in all their models.

Two— The Dunhill Chassis combines maximum strength and rigidity with minimum weight.

Three— On a weight for weight basis, the Dunhill patent triangular Chassis is the strongest on the market—on a load for load basis there is no lighter chassis.

Five— Dunhill Sidecar bodies are *smart.*

Six— Dunhill Sidecars *study the passenger.* The bodies are given really careful thought and are built for comfort and convenience on the road; their finish pleases the most exacting.

Seven—The greatest efficiency and service combined with absolute "passenger comfort," a Dunhill Sidecar is the one to buy.

Write to-day and get the Dunhill Sidecar Catalogue for 1921. It is of interest to every motor cyclist. Simply write your name and address on the margin of this page, tear it out and post to us.

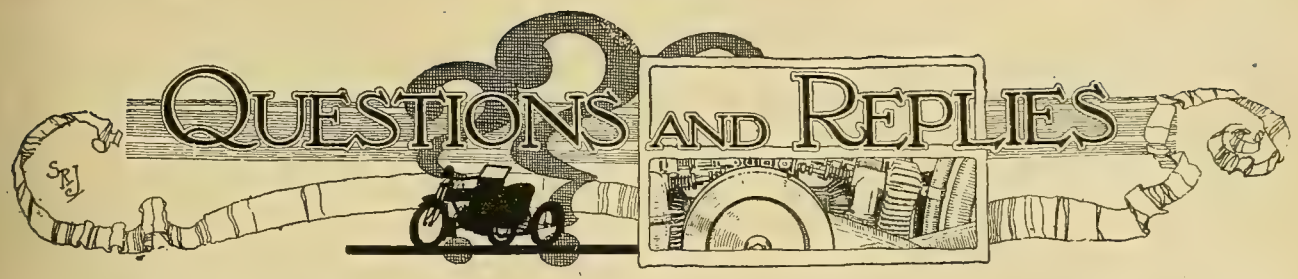
PETO RADFORD MODEL S.G. ACCUMULATORS

4 Volts. Capacity—12 ampere hour continuous, 24 ampere hour ignition.

DESCRIPTION.—Two separate cells consisting of 5 plates, each in a strong celluloid box with sealed lid, vent plugs and non-corrosive terminals; the two connected together by non-corrosive link and contained in strong black enamelled metal case with leather strap handle Never had acid in Weight 5 lbs. each.

Orders promptly executed.

WATES BROS., 132, Charing Cross Rd., W.C.2



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Pressed Steel Wheels.

I should be pleased if you would kindly inform me whether there is such a thing on the market as a motor cycle wheel built entirely of discs, minus spokes, etc.—R.A.B.

There are no spokeless wheels obtainable which are suitable for existing motor cycles. Several French makers are using them, however, also the manufacturers of the Unibus.

Long Exhausts Again.

Could you kindly give me the full particulars respecting silencers or expansion chambers on motor cycles? A friend owns a Rudge-Multi solo machine, which is fitted with a tube 5ft. 2½in. long, and he is now summoned for not having a silencer or expansion chamber.—R.G.C.

The law demands that the exhaust gas shall first pass through an expansion chamber before being released into the atmosphere. Whether a long pipe alone constitutes an expansion chamber within the meaning of the law is a doubtful point; but if the machine is reasonably silent, it might be possible to contest the case.

Rebuilding a Scooter.

(1.) Will a two-stroke engine rotate in any direction, provided it is timed accordingly? (2.) What size engine sprocket should I require if I fit a 2¾ h.p. two-stroke to my scooter? The size of sprocket on the 20in. road wheel is twenty-four teeth. (3.) Is petroil lubrication quite satisfactory on a two-stroke of 2¾ h.p.?—P.D.S.

(1.) Theoretically the two-stroke engine will run in either direction, provided it is timed accordingly. Practically, however, we cannot say whether it would be advisable to do this, as we do not know to what engine you refer. (2.) You cannot drive directly from the engine to a 24T sprocket on the right wheel, as you would require a reduction of about 6 to 1; this would mean that you would require a 4T sprocket on the engine-shaft, which, of course, is impossible. The smallest size you can fit on the engine-shaft to obtain reasonable satisfaction is 12T (½in. pitch), and, therefore, you would need one of about 72T on the rear wheel, which is impracticable. (3.) The petroil system is quite satisfactory if the engine has been designed for this type of lubrication.

Higher Gear Ratios Wanted.

I am in possession of a 3 h.p. Neal Dalm two-stroke motor cycle with a top gear ratio of 5½ to 1. I wish to give it a gear of 4 to 1. (1.) Would this be too high? (2.) What size pulley should I need? The driving sprocket has 18 teeth, the gear box sprocket 32 teeth, the rear wheel belt pulley is 19in. in diameter, the gear box pulley 6in. (3.) Which would be the most advisable to change, the pulley, the gear box, or the engine sprocket?—T.L.D.

Your present top gear ratio is approximately 5½ to 1, and it is probably the most suitable one for your machine. A 4 to 1 top gear would be much too high. In order to alter the gear ratio it will be necessary to fit a large sprocket on the engine-shaft. If you think the machine is under geared, try to get a sprocket with either 19 or 20 teeth—probably 19 would be the more suitable.

Accident to a Dog.

I was out for a run recently when I had the misfortune to run over a dog. I overtook a flock of sheep which was in the care of two men and two dogs. I had a passenger in the sidecar with me at the time, and I had the machine well under control, and was running very slowly. I had passed one man and dog, and was about half-way through the sheep when the other dog ran right into my front wheel, which went over its hindquarters. Both I and my passenger did all we could to attract the attention of the dog, which came into us suddenly (it was not looking in our direction). I pulled up within 3ft. of the dog, which lay on the ground, but after a short time it got up and walked away with the men. At the time of the accident one of the men was driving the sheep to the side of the road to make room for us to get by. Will you please give me advice as to my responsibility?—T.M.

Provided that you were not travelling at an excessive speed, and that you took every care to avoid a collision with the dog, and provided you can produce witnesses to support any statements you may make in regard to the case, we do not think that you can be held responsible for the injury. We should certainly advise you to ignore any demand made by the owner of the dog, and you should not in any way prejudice your case by offering him compensation. Allow him to take action if he pleases, and place your own case in the hands of a good local solicitor.

Copper Piping for Acetylene Lamps.

Is it dangerous to use copper piping to conduct acetylene gas to a rear light? I am using one generator, as now, in this weather, I have disconnected the sidecar, and ride solo; and, to avoid a long length of rubber tubing, I have used copper pipe, passing through the clips under the tank, and, of course, connected to the generator and lamp with short lengths of rubber tubing. I was informed recently that spontaneous combustion is likely to occur.—I.J.

The danger of using copper piping for acetylene gas is that the action of the latter upon the copper creates an explosive compound which is liable to detonate when subjected to a sudden blow. On a small scale, however, it is quite unlikely that the formation of this compound will be sufficient to cause any trouble, and we ourselves have used copper tubing for this purpose many times. As it is as well to be always on the safe side, however, it would no doubt be better to use brass tubing.

Compensation for Lost Machine.

On September 6th last I consigned my motor cycle to the makers at Coventry. It has been lost without any chance of recovery, and the railway company are willing to compensate up to the value of the machine when lost. It was purchased new in March of this year, and had run 5,000 miles at the time of the loss. The purchase price was £105. The whole machine was in perfect order, except in one or two minor details. In view of the fact that a duplicate of this machine could not be purchased much under list price at the time of the loss, I have claimed £127 10s., less £4, the estimated cost of the replacements. The company wish to settle on the basis of the cost of the machine; but I think this unfair, for the result will be that I have to lay out £24 through their fault, if I am to be sure of obtaining as good a machine as the one they lost. Will you please say what you consider would be a fair basis for the settlement of my claim?—C.F.P.

It is rather difficult to say what should be done in the case you describe. If the machine only cost £103 in the first case, and has since run 5,000 miles, we cannot think that it was in such perfect order as to be equal in value to a brand new and unused machine of the same make. If the railway company are willing to pay the full amount of £103, we think you would be wise to accept it.

A Converted Magneto Lighting Set.

I have converted an old magneto into a lighting generator by winding the armature with 23 S.W.G. I am driving it at one and a half times the speed of the engine, with the result that I am getting an output of 12.15 volts ½ ampère. So far, the results are satisfactory, as I am getting quite a good light. I am using a fuse in the circuit for safety in case of excessive speeds. (1.) Can I increase the ampères by winding the field magnets so that the lamps will be working in series with the field windings? (2.) Would 23 S.W.G. be suitable? (3.) What is the limit in ampères that 23 S.W.G. will pass?—J. T.

It is doubtful whether you can increase the amperage by doing as you suggest, as the magnets of a magneto are hardened steel, whereas you would need soft iron magnets to get the effect you desire. You might experiment with a temporary winding, so that the induced polarity assists, and does not oppose the polarity of the permanent magnet. 23 S.W.G. wire, the same as you are using for the armature, will answer the purpose. Wire of this gauge will pass about .75 amp. continuous current, but the limit depends upon the winding insulation, etc. Provided the armature does not become unduly hot, you may assume that everything is in order.

A Question of Date.

In January last I purchased a 1916 W.D. Douglas, advertised as uncrated August, 1919. This was my first essay at motor cycling, and as things were not quite as I thought they would be, I advertised the machine for sale as a 1916 2¾ two-speed W.D. Douglas, uncrated August, 1919, in your issue of April 22nd. Early in May, in response to an application, I sent the machine to a prospective purchaser, using your deposit system as a safeguard. After retaining the machine a week he agreed to buy, and on May 31st I received a letter from him to say that he had just spent a successful tour of the Lake District, and was in every way satisfied with the machine. On October 1st (nearly five months later), I was surprised to hear from him to the effect that he had just taken the machine down and found that the rear cylinder was of 1913 pattern, and accusing me of misrepresentation. He sent me no proof whatever, declaring that he paid £5 more than the machine was worth in the first place (which is surely his own fault), and saying he would be satisfied if I would contribute £7 towards the overhaul, or he would consider a reasonable offer. Unfortunately the gentleman from whom I bought the machine can only give me his word of honour that he actually saw it uncrated at Grove Park in August, 1919.—H.W.M.

Before the buyer can succeed in an action against you, he would have to prove that you deliberately misrepresented the date of the machine. There is no doubt that the explanation is that in the Army workshops, machines were frequently dismantled in large quantities, and after the separate parts had been put in good order, they were reassembled, and in consequence parts of various dates found their way into the composite machines, which were those turned out. You would be well advised to ignore the claim which has been made against you.

The Weight Basis of Taxation.

Re the new motor cycle taxation which comes into force next year, does the 200 lb. dividing weight apply to the machine *stripped of accessories*, or will these be added in arriving at the correct weight? I ask because I possess a lightweight which, without lamps, tools, etc., weighs just under 200 lb., but with them a few pounds over the mark. —INTERESTED.

Up to the present time no definite ruling has been laid down, but we assume that the unladen weight of the machine, as delivered by the makers, will be required. The tank should be empty, and the lamps, tools, etc., should not be included.

IMPORTANT DATES.

Dec. 10th-19th—
Brussels Show.

Dec. 27th-28th—
M.C.C. London-Exeter Run.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall Glasgow.

Effects of Prolonged Wear.

I have an old W.D. 4 h.p. Triumph, and I wish to know what to do to make it less noisy. There is a clatter, which seems to come from the valves. Also, what is wrong with the gear box? It does not slip at the clutch, but it jumps when in second gear.—H.C.

The noise arising from the valves is no doubt due to worn cam gear or to excessive tappet clearance. Probably new parts will be required. If the second gear jumps out repeatedly, it is almost certain that the operating mechanism is worn, and we should advise you to renew the pins and yoke ends which connect the control lever to the operating lever on the gear box.

Reliability of Flat-twin Two-stroke.

I am thinking of purchasing a flat twin two-stroke engine for building a cycle car. Could you advise me on these engines? Are they as reliable as a single-cylinder, and would there be any trouble from one crank case blowing through into the other?—G.H.

There should be no trouble with regard to reliability with this type of engine. You are mistaken in believing that there is a division between the two parts of the crank case; with the flat twin two-stroke, both cylinders fire at the same time, and consequently one crank case is sufficient for compression. Your greatest difficulty would be in obtaining a suitable form of ignition, and you would need to obtain a special two-spark magneto.

Magneto Lighting.

Can one draw current for lighting from an ordinary magneto, with a low-tension switch fitted, which serves also for the ignition of motor, and if so, what is the voltage of the lamps used? —HOLLAND.

Electric lights may be run from the low-tension switch of an ordinary magneto, as when the engine is running at its normal speed there is a considerable amount of surplus current. Four volt flash lamp bulbs are used. The system works best with twin cylinder engines, or two strokes; it is not nearly so satisfactory with single cylinder four-stroke engines.

Timing a Flat Twin Two-stroke.

(1.) What is the correct magneto timing for a 4½ h.p. Levis flat twin two-stroke engine? At present it is timed to fire at the top dead centre with magneto fully retarded. I notice, in answer to a question in a recent issue, you advise a more advanced timing for a Scott. Would my engine be improved in power by advancing the present setting? I am using a Thomson-Bennett double spark magneto. (2.) The carburetter fitted is an automatic Amac. What should be the probable size of jet required for this engine?—E.C.L.

(1.) The engine is correctly timed if the spark occurs when the pistons are on top dead centre, with the ignition control fully retarded. You may find a slight advantage by advancing a little further, but this is a matter for experiment. In the particular case to which you refer, we know that the engine will stand a greater advance. (2.) A 26 or 27 jet should be most suitable. The makers of the engine, however, might give you the benefit of their own experience if you write to them.

RECOMMENDED ROUTE.

CAMBRIDGE TO BURTON-ON-TRENT.—G.T.B.

Fenstanton, Godmanchester, Huntingdon, Ellington, Spaldwick, Hythorn, Thrapston, Cranford, Barton Seagrave, Kettering, Rothwell, Desborough, Market Harborough, Great Glen, Leicester, Groby, Hugglescote, Burton-on-Trent.

The Show is over—that is so far as Olympia is concerned. But the wonderful show at Godfrey's continues all the year round.

Here at 208, the motorist can inspect the latest models at leisure, and be sure of getting earliest delivery.

There are other advantages, too, in dealing with this well-known firm:

Every machine is tested before being handed to the customer.

Every second-hand machine is thoroughly overhauled and guaranteed.

Customers can either pay cash or take advantage of our Deferred Payments System—one quarter down, and 12 equal monthly instalments.

Make a point of calling on Godfrey's now the Show is over. If this is not possible, write for our full lists. We have still a few new 1920 shop-soiled combinations and solo machines at specially reduced prices.

DAVIS'

Ustikon

PATENT

SOLES & HEELS

No matter what world conditions make them cost you, we have continued to base Ustikon sole prices on actual shoe values—on what we put into Ustikon Soles—on what you get out of them—full value for what you pay.

No apparatus is necessary, nails or screws are obviated, and moreover, you get a sole that is absolutely waterproof. Surely Ustikon Soles are worth consideration.

Consider the wear not the price per pair.

GENTS', all sizes 3/9
LADIES', all sizes.. .. .. 2/9

Complete with Sol-fix and directions.

USTIKON HEELS

The wearing quality of these Heels is indicated by the fine workmanship and careful finish. In actual wear they are still better than you expect.

CARS FOR SALE.

SENSATIONAL Results of my systematic reduction scheme now apparent. If you want real bargains, come and see for yourselves. No need to take auction risks! If some of my cars don't appear cheap, remember many of them are most completely overhauled and renovated, and many almost equal new. Not a dud amongst them.—Cox (below).

TWELFTH Week of my astounding systematic reduction scheme! I reduce at least 10 cars by over £250 total each week. Total reductions to date over £4,000. Many cars below are absolutely absurd bargains, particularly some of the higher priced ones! This week 17 cars reduced £250! All advertised dates guaranteed accurate.—Cox (below).

TWELFTH Week Bargains.—6h.p. De Dion parcel van, mag., Binks carburetter, runs well, reduced from £85, now £20! 3-ton 1915 Seabrook lorry, many parts missing (but all parts can be obtained for £50—then worth £350), bargain, £35; 15h.p. old type chassis, unknown make, about 1902, 4-cyl., live axle, gate, Bosch, Zenith, real antique, £40! 20h.p. Leon Bollee chassis, live axle, enclosed valves, 4-speed gate, reduced from £185, now £75! 1920 Wooler flat twin countershaft bicycle, shop-soiled only, list price £103, reduced £78/10 (fine Christmas present); 14-16h.p. Belsize 4-5-seater, live axle, gate, Zenith, pulls splendidly, £90; 1920 A.V. monocar, extra pillion seat, electric lighting, as shown at White City for £165, bargain, £120! 12h.p. F.R.S.

A NEW Generator —with all the irritating faults eliminated!

Yes—there *have* been faults—we admit OURS—but we have profited by EXPERIENCE, and THIS Generator embodies improvements which make it absolutely foolproof.

It gives a uniform supply of gas, ensuring a clear, steady light—and will generate sufficient gas for Head, Tail, and Sidecar Lamps.

Ask your agent to show you one. All the Headlight sets now being sent out have this **new generator.**

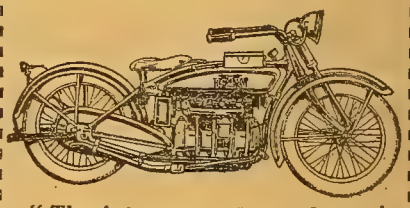
GET A NEW 1921 'HENDERSON'

Four-cylinder



"The Aristocrat of Motor Cycles"
and
"The Last Word in Motor Cycle Efficiency."

HAVING just received a large shipment, we are at the moment in the happy position of offering you

IMMEDIATE DELIVERY!
with or without Sidecar.

THE 'HENDERSON'
Four-cylinder
IS a truly NEW 1921 Model,

embodying such radical changes in design and construction that other high-powered machines will be left years behind.

DURING the past year only a few "HENDERSON" machines have reached this country, the majority being 1919 models. Large shipments of New Models, "Perfect in every detail" and the most comfortable and safest motor cycles on the road, have arrived. The makers rightly claim "that no motor cyclist who has not ridden a 'HENDERSON' has learned the full enjoyment of motor cycling."

The Henderson can now be supplied with a REVERSE GEAR if required — ideal for Taxi-Sidecar work.

THE MOTOR CYCLE

Insurance Policy

Testimony

THIS space will be occupied each week with copies of letters from Policy holders who have made claims. Original letters may be inspected:

Dear Sir,

....May I say what a pleasure it has been to me to receive such courteous and considerate treatment at your hands, and, above all, to recognise that although a Company, you are by no means bound up in red tape, and are willing to take a personal view of things.

Again thanking you.

The only Safe Test of Insurance is Claims. We settle Claims promptly.

The AUTOCAR FIRE and ACCIDENT INSURANCE COMPANY, LIMITED.

Incorporating The Autocar Insurance Department, Established 1904.

'The Missing Link'

suggested in the Darwinian Theory may have been something between a monkey and a man. That is probably something you don't worry about, but what *does* concern you—vitally—is THAT missing Link—THE FORWARD—you had always intended to buy but never did, when, stranded miles from anywhere with a broken Belt, you hunt frantically through your spares for anything as a makeshift.

And—after a fruitless search and an equally hopeless half-hour or so trying to make a Belt, already stretched to its utmost, strain just that extra fraction of an inch which the FORWARD or KING HOOK LINK would have bridged, well—it generally ends in pushing "the bus" home, doesn't it? And, trudging the weary miles you vow you'll get a FORWARD at the first opportunity. So, with the bad weather coming on, let that opportunity be NOW; select your Fastener and Spare Link from the following, add a Forward Belt Punch, and you are safe against any possible belt trouble.

The Forward Fastener 1/9
The Forward Leather-covered Link 1/6
The King Hook Fastener—Detachable 1/3. Adjustable 1/6
The King Hook Leather-covered Link 1/-
The Forward Belt Punch 3/6

Inexpensive, aren't they? But what a world of difference they would make to ——— YOUR peace of mind. ———

FORWARD SPARKING PLUG CO

1921?

Let us help you.

¶ Perhaps you have been waiting for the Show before deciding which make of machine you would purchase for 1921, and now, having studied the various makes of machines exhibited, you have possibly realised that it is difficult even now to make your choice from the great number that appeal to you.

¶ The importance of real and practical experience in these things strikes you as being most necessary; all the observation and discernment which you have brought to bear upon the matter does not appear to help you very much in a choice of the best where there are so many that are good.

¶ It is our business, and not only our business but our delight, to assist you in that choice which many years of practical experience entitle us to offer.

We hold no brief for any particular machine, but make it a point to sell only the BEST—let us know what you are looking for, whether you want solo or combination, miles per hour or miles per gallon, and we will take pleasure in advising you, whether you contemplate purchasing from us or no. We offer you the same guidance that we have given to the many others who are now our lasting friends.

¶ Your enquiry by post will receive exactly the same attention as a personal visit.

Write to us NOW.

You are under no obligation; the obligation is ours to advise you and help you. You stand to lose nothing, and to gain a lot.

— THE —
SAXON
AT OLYMPIA.

The praise and admiration showered upon Saxon Spring Forks at the Show marks just another instance of the great popularity enjoyed by the best of all spring forks. Saxons still remain pre-eminent in shock absorbing qualities, giving perfect ease in steering and vibrationless comfort awheel.

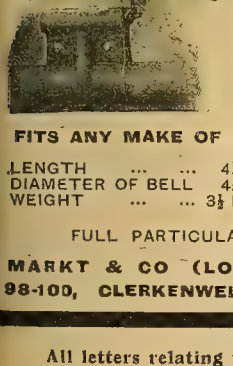
THE LONG HORN

Mechanical—not a Musical Box.



THE function of a horn is to sound an alarm to clear the road—the Long Horn does this more effectively than any other warning signal at present invented. The Long Horn is **not** a musical box but a real road clearer—the hoarse growl does the trick **at once**; better scare a pedestrian than kill or injure him with disastrous consequences to follow.

Fit the Long Horn to your car—it's the safest alarm under any circumstances. It can be modulated according to pressure from a mild warning to a sharp attention—compelling command.

FITS ANY MAKE OF MOTOR CYCLE.

Motor Engineers,

Fleet Street, SWINDON

"MABON" SPRING SADDLE SUSPENSION.

An excellent fitment. Adaptable to most machines. A smooth, floating action without rebound over the roughest roads.

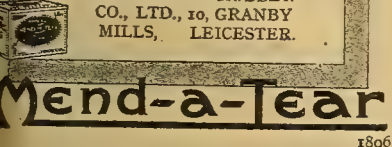
PRICE 45/-.

All steel, plated finish.

Extract from *The Motor Cycle*, Nov. 11th, 1920 :—"Having recently tested one, we find that it is just as efficient in action as it is strong and well finished in appearance. In fact, so excellent is the suspension afforded, on the most atrocious surfaces, that we were apt to forget that the machine was not similarly insulated"

MABON MOTOR WORKS, Woodside Gardens, Bruce Grove, Tottenham, London N.17.

Mend 'em with



Wherever you are, and whatever the size or shape of the tear, you can mend it quickly, without stitches, with Mend-a-Tear. Sold in 1/- cartons, or free sample for 2d. stamped addressed envelope.

FORFIELD MOTORS,

11-13, FORFIELD PLACE,

LEAMINGTON SPA.

TRIUMPH PARTS

MISCELLANEOUS.

GOVERNMENT Surplus; on approval for cash. New goods.—Australian boots, 30/-; blue, white, and khaki gloves, 1/11; natural flannel pyjama suits, 12/11; naval oilskin suits, 15/-; naval all-wool socks, 3/6; Canadian Cardigan jackets, 15/-; gent's brown and black field boots, 45/-; rubber thigh and knee boots, 20/-; post extra.—M. C. Lethbridge and Son, 75, George St., Devonport. [2303

DISCS.—We are makers of discs for any type of motor cycle, polished aluminium 25/- and 30/- per wheel, enamelled steel 20/- per wheel, Rudge Multi discs 5/- per wheel extra; discs for Douglas, Triumph, Indian, Harley-Davidson, and Rudge Multi motor cycles always in stock; prompt deliveries.—Hill and Co., Discs Specialists, 1 and 3, Walmersley Rd., Bury, Lancs. [0351

COPPER Exhaust Pipe (polished), all sizes in stock from 2/9 ft., bending a speciality. Cast aluminium footboards, upcurved front and heel-piece, checkered top, with adjustable clips, easily fitted to most machines; B.S.A., Levis, Sunbeam, Triumph, Douglas, etc., 17/6 pair, carriage paid. Wheels, forks, belt rims, hubs,, handle-bars, mudguards, etc., in stock; write us your requirements. Complete sets for home assembly; single-speed £45, 2-speed £52.—Evans Bros., Brougham St., Hockley, Birmingham. [X2878

WHEELS, Wheels, Wheels.—Motor cycle wheels built to order, all sizes in stock. Motor cycle frames repaired, altered, and brought up-to-date. Sidecar chassis repairs, discs fitted 26in. wheels, steel front 20/-, back 22/-, enamelled black, others to order. Contracts wanted for frame and wheel building, customers' own materials. Motor cycles overhauled, re-enamelled, plated, 2¾h.p. £8/5, 4h.p. £10. Wanted, belt rims, all sizes, cheap for cash. Stamp enquiries.—Pendleton, 28, Lonsdale Sq., Liverpool Rd., London, N.1. [1848

AEROPLANES.—Splendid Xmas present for your boy; genuine flying models, automatic stability, the result of years of experiments; signed guarantee with each one; 9in. twin screw, 3ft. long, 22in. span, will rise off ground after run of 15 to 20ft., and fly 300 yards; 10/6 postage 1/-; smaller size 6/-; postage 1/-; competition model, rise off ground, length 3ft. 6in., span 30in.; 17/6; postage 1/6, as sold in the large stores at double these prices; testimonials gladly shown.—M.S. Aviation Co., 21, Moring Rd., Tooting, S.W.17. [7587

500 Douglas Forks, 25/-; handle-bars, 12/6; 500 P. and M. frames, 25/-; tanks, perfect, 20/-; Grado gear, K.S., £9; 1,000 large car spanners, 4/-; 1914 Roc 2-speed back wheel, complete, stays, etc., £9; 2-speed wheel, all chain, £3; complete new, light back axle, hubs, centre differential, and chain drive, enclosed, £15; new 3-speed and reverse box to fit, £12; 1920 sporting canoelet sidecar, £17/10; sidecar body to order, from £8/10. Ask your wants. We repair, renovate all kind of motor goods. Buy, sell, and exchange new second-hand. Payments arranged.—Montague's Motor Mart, 85-87, London Rd., Manchester. 'Phone: 7745 Central. [2411

1916 New Imperial, 2¾h.p., 2-speed, clutch, and K.S., in splendid condition, date guaranteed, £40; 3h.p. unit, complete with magneto, adjustable pulley, Amac carburetter, silencer, and engine plates, sound, £10/10; lightweight dropped frame, complete with 26in. wheels, Druid forks, tank, Lycett's pan saddle, handle-bars, front and belt rim brake, £12; Bosch magneto, auti, guaranteed by Reliance Magneto Co., £2/15; head lamp and generator, £1; polished aluminium mechanical horns, 15/6 each; offers considered. Please send stamp if you require a reply. 3½h.p. P. and M. wanted, cheap.—A. S. Phillipson Hilda St., Grimsby. [2404

THE Cheapest House in the Trade for Accessories.—Mabon gears, £10/8; clutches, £6/1; sidecar bodies, 7 varieties, £7/15 to £10/15; Nelson hood, £4/10; Blumel wind screen, £4/10; the Easting, £4/10; the Orto, 52/6 and 72/6; the Raper, 57/-; the Cameo, £3; the Wallboro, £2/10; Taylor's, 33/6, 37/6, and 51/-; luggage grids, 25/-; storm aprons, 23/-; sidecar stand, 14/-; underslung chassis, £11, step body type; £7/5; auxiliary arms, 17/9; spring shackles, 6/6 set of 4; magnetos, M-L. £10/14/6; E.I.C., £8/10, all leading makes stocked; Watford speedometers, trip, £6/5, plain model, £5/15; Enot's drip-feed, 38/6, Best and Lloyds, 28/6; pillion seats, Tan-Sad, 44/9; Tynesider, 52/-; Willowbrook, 29/-; the Juno, 18/6; engine pulleys, fixed, 4in., 13/9; 5in., 14/6; 6in., 18/6; adjustable, 4in., 25/6; 5in., 27/9; 6in., 30/-; 7in., 32/6, made to order; College mudshields, 32/6, 16/6, 12/-; aluminium legshields, 36/6; footboards, 15/- and 17/- pair; 3½in. and 4in. mudguards, 14/6 and 16/6 set; W.S.R. adjustable jets, 8/6; waterproof suits, 61/-; seatless trousers, 23/-; leggings, 14/6; leather helmets, 10/6; goggles, 4/6, 3/6, and 2/-, Triplex 12/6 and 15/-; gauntlets, 14/-; carburetters, B. and B., Amac, Senspray, and Binks at makers' prices; Bowden control levers, 7/10; band brakes 44/- and 61/-; front brakes, 39/-; and 49/-; foot brakes and footrests, 48/9 and 23/9; cross-over brakes, 51/6; bolt rim brakes, 17/9; magneto control, 25/-; Lucas No. 462 lamp set, £4/17/6; P. and H. lamp sets, No. 145, 60/-; No. 125, 55/-; sidecar lamps, 11/9 and 12/9; rear lamps, 6/9; Lucas horns, 27/6 and 14/9; mechanical, 15/6, 30/-, and 37/6; Clyte mirrors, 13/-; Brooks B170 saddle, 60/-, B14 67/; Lycett's pan seat, 43/-; Ukantes stands, 13/6 pair; tubular carriers, 15/6, extra strong, 22/6; pannier bags, 6/6, 11/6, and 14/-; Auto-Wheels, in new condition, £25 cash; large illustrated list, price 6d.; its perusal will repay you.—M.Y. Dept., The Metropolitan Machinists Co., Ltd., 248, Bishopsgate, E.C. [2650

MISCELLANEOUS.

GOVERNMENT Surplus.—Leather waistcoats, li flannel, 12/6; all wool cardigans, 10/6 ne officers' field boots, lace up to knee, black and (new), 47/6; solid leather leggings, whole bac spring fronts, black or tan (new), 11/6; effec trench coats, lined rubber (new), 32/6 with be officers' brogue shoes, tan, 21/-; rubber thigh bo (new), 17/6; naval boots (new), 21/-; army w natural shirts, 12/6; all goods post paid; appro cash with order.—Army and Navy Stores, Wens St., Norwich. [2

LAMPS: Lucas, Miller, P. and H., Howes Burley, large, £1; smaller sizes, 15/-; ex-Gov ment stock, undamaged, postage 1/-. Brackets of descriptions, 3/- per set, ready to fit on machine, missing bolts, etc. When ordering, please state t required, rough sketch preferred. Handle-bars, Government, sound, black, 5/-; P. and M. Triumph, various others, plated, 10/-; postage ex Money returned if not satisfied.—Snodgrass, 18, Jr tion Rd., Brentwood, Essex. [2

TRIUMPH Engine Sprocket, 4/-; Triumph T.T. h 12/6; Watford speedometer, almost new, cost sell £4; Tan-Sad, 25/-; Lucas lamp and generator, g as new, 25/-; Amac carburetter (2-stroke), complete y controls, £1; another, without controls, 15/-; X saddle, good condition, 16/-; 2¾h.p. Douglas sproc gear box), 6/-; Indian chain, long, 10/-; back wheel, Triumph, 12/-; new toolbag, 5/-; second-hand, 3/-; ¾in. belt, 8ft., 12/-; Douglas clutch pedal, 1913, 5 postage extra.—L. Bull, 44, Hills Rd., Cambridge. [3

HEPPELTHWAITE'S.—50° C.A.V. magneto, n £5/5; Best and Lloyd drip, new, 15/-; 26x studded Dunlop, new (not clearance), £2/5; tu 6/6; Bowden magneto control, with cable, etc., 10 Advance adjustable pulley, 10/-; Cameo wind scre new, £2; lamp and generator, new, 30/-, P. and Amac carburetter, 1920, £2/10; Bluemel's pump, 6/6; 6-cyl. magneto, in parts, 25/-; h shaper machine, £12, new; 6in. screwcutting tre lathe, £30, heavy tool, all change wheels and ch etc.—19, Wilcox Rd., South Lambeth, London, S.V [2

The Brussels Show.

ONLY pioneers among British motor cyclists and motor cycle manufacturers know how much the whole movement owes to the early designers in Belgium. It is now almost ancient history that most of the earliest British motor cycles were engined by the products of our gallant little Ally across the Channel. The first motor cycle engine to have mechanically-operated inlet valves hailed from that country, and right up to the outbreak of war a large number of British engine makers obtained their cylinder castings from Belgium.

It was with these facts in mind that we visited the Brussels Show, which opened on Friday last, and, knowing the main reason why the Belgian motor cycle industry has not made greater headway, we were surprised to see the number of motor cycle exhibits included.

We refer to the rough state of the Belgian roads, which are of a character that no motor cyclist who has not visited the country can possibly form a true conception. Undoubtedly, good roads have popularised the motor cycle in this country just as the pneumatic tyre made it possible and the magneto gave it reliability.

It must be a matter of great satisfaction to the British industry to know that their products easily predominated; in fact, the number of British makes represented outnumbered the combined representatives of America, France, Belgium, and Switzerland. Practically every make of American machine was exhibited, as compared with about 20% of those British makers who exhibited at Olympia.

Elsewhere in this issue we illustrate and describe the chief Continental exhibits, many of which reveal new lines of thought in connection with motor cycle design, in which connection we are in a position to state that at least one of the designs bears a close resemblance to a machine now being tried out by a British firm, and which may make its appearance in the spring.

Undoubtedly the Belgian people are keenly interested in motor cycles, but it will not be until the roads are of better quality that the single-track machine will come fully into its own in that country.

Spring Frames or Spring Seats?

THERE is much evidence at the present time that manufacturers are devoting their attention to the comfort of the rider. A number of new saddle springing devices appeared at the Olympia Motor Cycle Show, though the number of spring frames increases almost imperceptibly.

There are two distinct schools of thought in regard to suspension, some of our best known designers holding that it is advisable to reduce unsprung weight to a minimum, whilst others maintain that it is only necessary to provide increased comfort for the rider.

At the present stage of the industry, the latter alternative is perhaps the most satisfactory solution, since modern motor cycles have been proved to be capable of withstanding all reasonable road shocks, whilst it is certainly easier and less costly to produce a good saddle suspension than a really effective spring frame. The question of road adhesion is bound to crop up in any controversy on this subject, and here also the sprung saddle devices will score to a certain extent, though wheel slip is not likely to affect the normal rider on average roads.

Looking forward to future development, we cannot help thinking that the spring frame will be the ultimate solution of the problem. It has already been shown by more than one machine that a good spring frame is possible, and it remains an undoubted fact that, if properly carried out, rear springing saves the engine, transmission, tanks and cycle parts to a considerable degree and permits of certain weight reduction in these parts. It is noticeable also that several spring frame machines are heavier than their predecessors with rigid frames.

An index to the advertisements in this issue will be found on the page facing the back cover

Occasional Comments by "Ixion"

A Good Stunt.

ONE of the most appreciative crowds in the Gallery at Olympia was to be found all the week in front of the Villiers stand, where four of their new flywheel magnetos were sparking visibly at engine speeds varying from 60 r.p.m. up to 1,350 r.p.m. At 60 r.p.m. the spark was not frightfully impressive, but as this gait corresponds to 1 m.p.h., who cares? By the time the speed was equal to 8 m.p.h., the spark had become so fierce that it literally crackled; and at 1,350 r.p.m., the spark showed an intensive recklessness which I should judge to be equal to igniting Government beer or Bolshevist gas.

Exhibitors' Leg-pulling.

EVERY morning, before the crowds flooded Olympia, exhibitors tried to cure the inevitable "Show head" by pulling each other's legs. About 9.30 a.m. Jones (who is in a very small way, and exhibits two machines on a stand the size of an ordinary blanket) meets Smith (who is a super-manufacturer, renting about .5 of the total floor space). They confer as follows:

Smith (condescendingly): "Hello, old chap, how's business your way?"

Jones (attempting to conceal his natural gratification): "Not so dusty. I've sold my output!"

Smith (in malicious envy): "You never mean to say *you've sold them both?*"

A Question of Principle.

IN the conversation of some experts no less than in the technical press one encounters suspicions of the tendency to make the three-wheeler chassis heavier, more refined, and more elaborate. Why? Two points are quite clear. The heavier and the more complex a 'bus is, the more it will cost to buy and to run—a Rolls-Royce is a costlier possession than a Levis Popular. That goes without saying, and we naturally expect a New Hudson to be more expensive than a Morgan. On the other hand, isn't it nonsense to assume that the heavier and more elaborate outfit *necessarily* gives more trouble? I don't suppose Mr. Butterfield will charter a gunman to pursue me if I suggest that a Rolls-Royce is possibly a shade more reliable even than the Levis? Is it not, therefore, begging the whole question to denounce some of the new three-wheelers before we have tried them out on the road?

Gear Changing Made Easier.

FACTORY repair shops record the secret history of the [illegible], and the tendency in gear box design being towards the constant mesh type with [illegible] I guess that the sliding pinion type [illegible] chauffeur drivers. I confess that to this day I sometimes make a horrible noise in getting down from top [illegible] low, after a slow up in traffic. It [illegible] on your driving, you don't like to ra[illegible] engine, and [illegible] hanger on the level wants quite a lot of throttle to get silence out of some gear boxes. Well, the "stepped dog" (as in the new Comery box) is going to be a real help. Instead of trying to mesh teeth in notches which show the barest clearance over the teeth, you begin by slipping dogs into notches which may be 3/16in. wider than the dogs. This is easy. The subsequent engagement of the second "step" of the dog with the second "step" of the notch is practically automatic.

A Recollection.

FREAK hills naturally bulk much larger in the clubman's purview than in that of ordinary users. But, after all, some ordinary users have to climb pretty freakish hills as part of their daily riding; and as balance is at best a dubious factor in scrabbling up a freak hill on a two-wheeler, the three-wheeler's amiability in such climbs is of special interest to people who live in strenuous districts. We all know that driving grip of the rear wheel causes acute anxiety to our three-wheeler super-cracks on freak hills, and that their pet expedient is to concentrate extra weight (*e.g.*, a suitcase full of stones) in the tail. This being so, one's memory harks back to such 'buses as the 1906 Riley tri-car, which had its engine behind the driver's seat. Cooling—both by water or direct air—has made such strides that the stern position of the engine is now quite practicable, even for large horse-powers; moreover, it would simplify and lighten the chassis quite a lot. I rather wonder that not one of the newest cycle cars coquets with this solution of the problem. The Scott approaches it by a *détour*, and the rest wholeheartedly give it a miss.

Automatic Lubrication.

FOR years I have asserted that the average motor cyclist yearns for a car type of lubrication system, which he can commit to oblivion until a warm smell or an ominous clanking in his engine cause him to dismount hurriedly and start blowing through a lot of very greasy pipes. [N.B.—This should not occur often.] We have had various essays in this direction. The old Wartnaby-Draper machine went the whole hog, and expired in the effort. Various American engines without quite attaining my ideal, travelled much nearer towards it than the average Britisher. At the Show we greeted three machines which embody this most practical principle—the Velocette, the new Bradshaw, and the Superb Four. In addition, all "petroil" machines (including the Scott Sociable) and most Americans offer very similar convenience. How soon can such a system be applied to a high efficiency single-cylinder? For critics must never forget that the Americans have enormous engines, which cannot be run all out on British roads, and so do not subject their bushes to such heavy stresses. A good many riders intend to experiment with the new B. and L. pump, which is quite easily fitted to most standard machines at a low cost.

The Ladies' Model Overseas.

IT occurs to me that the perfection of cheap, light ladies' machines represents a profitable extension of export business. Of course, bad roads, fierce beasts, and the native question forbid a woman to motor cycle unaccompanied in many of our —— (confound this awkward word; whether I call them "colonies," "dependencies," or "dominions," somebody will take offence: anyhow, you know what I mean). But, after all, there are lots of corners of earth where the lonely white woman could get about alone if it wasn't for the distances and her utter lack of suitable transport. In this connection, it is interesting to hear that one firm of two-stroke manufacturers has exported forty ladies' models to India alone this year.

Two Types of Big Twin.

THE big air-cooled V twin-cylinders are at last diverging into two separate classes. In reality there are perhaps three separate patterns, viz.:

(*a*) The motor cycle type.
(*b*) The dual-purpose type.
(*c*) The cycle car type.

In the past most of our big twins have been designed as dual-purpose engines, for sale to firms who make big solo twins, sidecar pullers, or cycle cars indifferently. To-day we have the 10-12 h.p. New Hudson, the G.N. 90° twin, and the M.A.G. 90° twin all deliberately designed for cycle cars. Practically all the rest are motor cycle engines. What's the difference? Well, ideally there should be quite a lot. There is room for a 90° engine on a cycle car chassis, but not in a motor cycle frame. There is room in a cycle car for a big oil sump under the engine, but there isn't room on a motor cycle frame. There is no reasonable limit to the height of a cycle car engine: there are narrow limits on a motor cycle. On a motor cycle you must have your carburetter between the cylinders, and your magneto behind one of the cylinders: on a cycle car these fittings can be put wherever you prefer. A cycle car engine is required to run declutched for much longer periods than a motor cycle engine. Before long the "dual-purpose" twin may die out, and be replaced by engines specially designed under the freer scope which a cycle car permits, and also by engines specifically planned for diamond frames. Consider the cam gear on the New Hudson engine, and you will see what I mean.

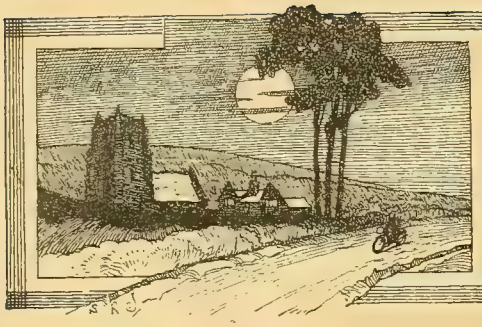
Ladies' Models.

SOME of the firms who list special ladies' models (especially in baby two-strokes) have been astonished and caught napping by the keen demand for open frame models during the last month or two. One firm, for example, received about nine times more orders for men's models than for ladies' until August. Since then the latter model has sold the more freely of the two. The almost universal provision of clutches and kick-starters on modern lightweights, if only as an option, will infallibly extend the conversion of the fair sex, for paddling off from cold is sometimes a fairly stiff proposition.

QUAINT, OLD-WORLD ARCHITECTURE.

(Left) This old inn at Norton St. Philip, Wiltshire, can claim to be one of the most picturesque as well as being the oldest licensed village inn in England.

(Right) Another quaint Wiltshire corner — Lacock village, near Chippenham. The outfit shown is a 4 h.p. Douglas.



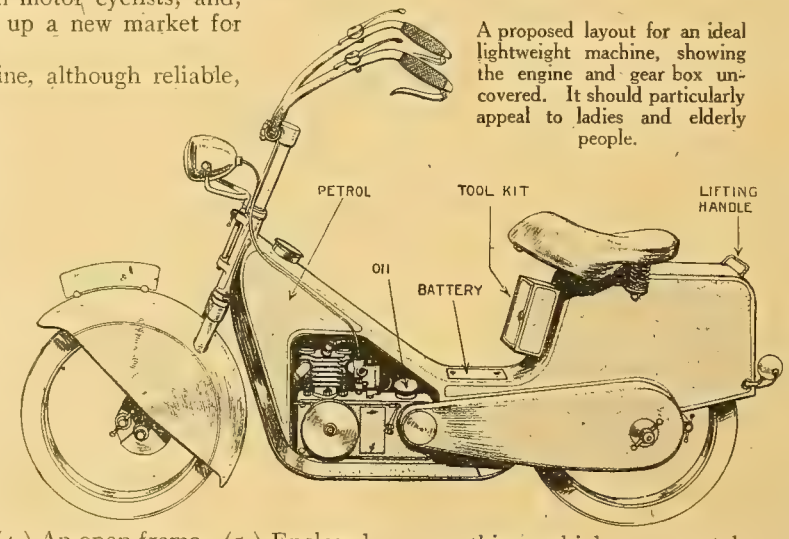
THE IDEAL MINIATURE.

Some Considerations of Design in a Lightweight Motor Cycle for the Fair Sex and the Elderly.

IN considering any design for a lightweight in the future, it is almost a certainty that the lady cyclist will have to be catered for to an equal extent as the other sex. This is a fact which becomes all the more patent after observing the big increase in lady drivers of motor cycles.

Whether the expansion in the number of women motorists is due to the more advanced age in which we live, or the gradual removal of common prejudices against women indulging in outdoor sports, must be a matter of opinion. In any case the advent of a lightweight motor cycle of a really suitable type would do an immense amount of good in further increasing the number of women motor cyclists, and, incidentally, opening up a new market for manufacturers.

The average machine, although reliable, requires a certain amount of physical effort in its use, being rather heavy for the average woman or elderly person to lift about when required. To appeal to the large potential market waiting for the advent of a more suitable machine, it should have the following features: (1.) Low price. (2.) Low weight. (3.) Low riding position. (4.) An open frame. (5.) Enclosed power unit and transmission. (6.) Perfect mudguarding. (7.) Freedom from wrist and arm vibration. (8.) accessibility. Such a machine would appeal not only to would-be women drivers, but also to a great number of elderly people of both sexes to whom the above points are essential.



A proposed layout for an ideal lightweight machine, showing the engine and gear box uncovered. It should particularly appeal to ladies and elderly people.

Speed not Wanted.

Speed should be no criterion at all, 20 m.p.h. probably being the maximum required at any time; but an ideal lightweight, as outlined, would have to climb any hill under its own power.

The mount which makes the greatest appeal to the prospective lady motor cyclist is the seat-type scooter, now grown into a miniature motor cycle; but the wheels fitted to most of these little machines are a shade too small to give full comfort on a long journey over bad roads. The ordinary 2½ h.p. lightweight motor cycle, on the other hand, is considered to be too bulky and heavy for the timid rider, and is difficult to mount and dismount without some exertion.

It remains, then, for a lightweight machine to be evolved which shall be something of a hybrid between the scooter and the ordinary motor cycle, with comfort, low weight, and manageability as prime features introduced in the design. In the illustration an endeavour has been made to embody such features.

Clean Exterior Essential.

The frame of the proposed ideal lightweight is semi-open, to give plenty of room for dress and to facilitate mounting and dismounting. This is probably the most important feature of all, since there is nothing which deters women and elderly folk so much as difficulty and awkwardness in arranging one's self on the saddle. Either pressed steel construction, or tubing and aluminium sheet covering, is suggested for the frame, and the outer surface must be as free as possible from anything which can catch or entangle the dress, such as bolt heads, controls, and external engine fittings. In the centre of the frame is mounted the engine and gear box, which are shown as built in one self-contained unit and completely enclosed within the frame, with the exception of the cylinder fins for cooling purposes. A 2 h.p. single-cylinder four-stroke engine is proposed, having a T head cylinder, outside flywheel incorporating magneto, single lever carburetter, and the crank case, which is in the nature of an oblong aluminium box, is extended rearwards to carry a small countershaft two-speed gear unit. Incidentally, this case acts as an oil container for both engine and gear unit. The object of forming the engine and gear unit as a whole has been to bring all the essential motive parts together and simplify design and construction, and when overhauling is necessary, to enable the whole engine and gear box to be withdrawn *en bloc* from the frame. No clutch or kick-

The Ideal Miniature.—

starter is incorporated as these features, although no doubt desirable from the point of view of convenience and ease of handling, are not absolutely essential, and their elimination from the design tends to reduce complication and manufacturing costs.

Transmission, Wheels, and Springing.

The transmission to the rear is taken through a chain which, with its case, is outside the frame to give the maximum of accessibility. To enable this to be carried out, the rear sprocket is carried on a short hollow shaft on roller bearings concentric with the rear wheel spindle, and drives the wheel through a small dog clutch.

To facilitate tyre repairs, the wheels are detachable and interchangeable, and of not less than 20in. in diameter, with fairly large tyres. Some form of spring forks is essential, with lateral stability in action, but without a large number of working parts. If large tyres are used, less tyre trouble is likely to be experienced, and spring suspension for the rear wheel may be unnecessary.

Providing for Comfort.

A large saddle is shown in the illustration, and it forms an important point in regard to comfort on bad roads. The saddle has a peak, and is not of the pan type, since the absence of any part in the centre of the machine for the purpose of knee grip makes the former type of saddle desirable, since it is of some assistance in enabling the rider to maintain lateral stability.

With regard to general equipment, it is suggested that comprehensive mudguarding should be fitted over the front wheel as well as knee shields at the front part of the frame, and that the rear wheel should be covered in as shown in the illustration. Efficient protection against mud and oil stains is a matter demanding a good deal of attention if the machine is to be a success. For lighting purposes, a well is formed in the frame behind the engine unit for the reception of a dry battery for the head and rear lights. An accumulator could be used if desired, but as a rule women and elderly riders do not ride much at night-time, and a dry battery may be all that is required. The tool kit is contained in a detachable case under the saddle—detachable, in order that the tools can be packed in comfort without bending down during the process.

Suitable for All.

This proposed outline of an ideal lightweight has no claims for originality, but the writer makes a bid for a machine that shall hold a greater attraction for the class of person for which it is designed. Perhaps one has only to suffer from some infirmity to realise that the majority of machines at present on the market offer no attraction for those people who are physically weak and incapable of handling machines seemingly built for the strong and sturdy, but who at the same time just as ardently desire the delights of motoring and its wide possibilities. M.M.

Unhonoured Gold Medal Performances are often the Lot of Trials Officials.

At all open trials an A.C.U. steward is in attendance. Here is a well-known A.C.U. Consul, wearing the steward's armlet, and accompanying the competitors in a recent Midland trial. He is riding a Beardmore-Precision.

The Sporting Solo Mount

Seekers after the Super-sporting Machine have a Widened Choice for 1921. The Return of the Medium-priced Solo Mount.

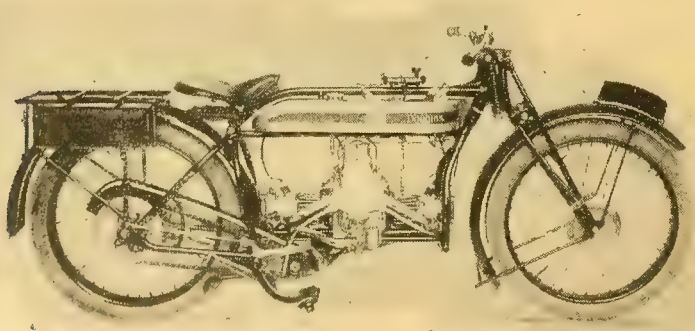
OF late years the sporting solo motor cyclist has, with some justice, complained that his interests and tastes have been neglected in the rush to cater for the family man, and the family man's family. One by one sporting mounts have been strengthened, enlarged, and developed generally as machines intended for *sidecar* work, but which could also be used solo. The solo enthusiast who requires something more than a lightweight has, however, been insistent in his demands, and so 1921 brings a change.

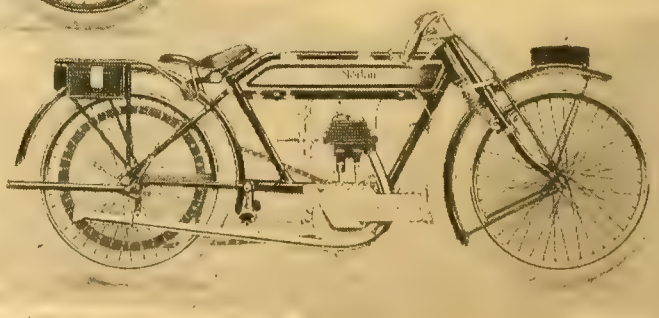
A Revival.

A list of purely solo machines with a sporting, as distinct from a utilitarian flavour, now includes some of the most famous names in the industry. Those who regard motor cycling as a sport—and the finest sport of all—continue to form a large section of the fraternity; and certain manufacturers are realising this, while those who ignore the requirements of the sportsman and fail to give him what he wants are losing a very good class of customer, to say the least.

The Genuine Sports Mount.

Our present purpose, however, is to deal particularly with the existing, revived, and entirely new "super-solo mounts" now in the lists. No attempt has been made to include solo mounts which have been primarily designed for dual-purpose work, but rather shall we deal with essentially solo machines even though they may be capable of light side-car work. For example, the 4 h.p. Triumph is not included; although it is one of the most popular mounts on the road and seldom need remain long in anybody's dust, speed is not the main reason of its existence. (The single-speed T.T. model is not listed for 1921.) The same applies to the majority of present day dual-purpose mounts.

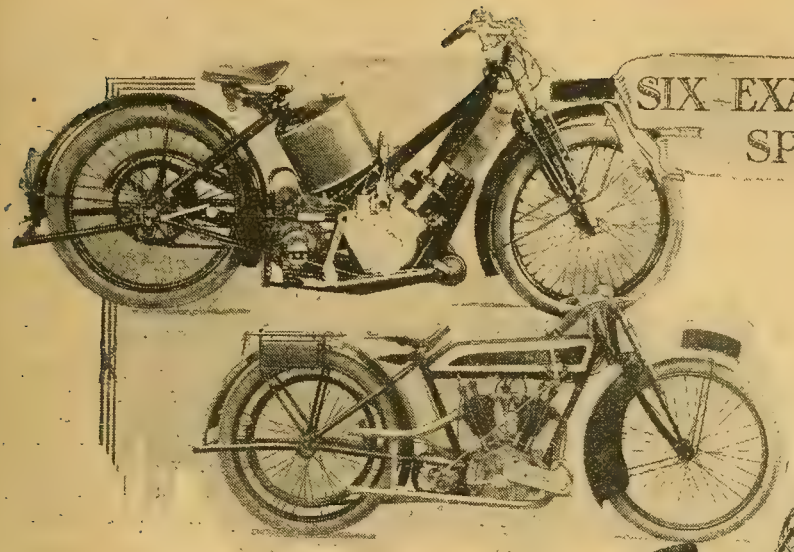




SINGLE AND FLAT TWIN.

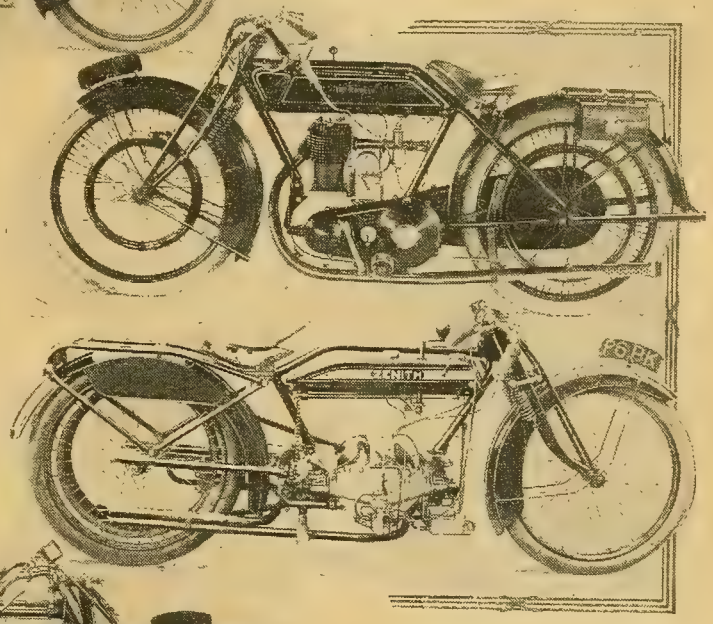
Two models with familiar names, both of which are admirable sporting solo mounts, the 3½ h.p. o.h.v. Douglas and the T.T. Norton.

SIX EXAMPLES of MODERN SPORTING MOUNTS



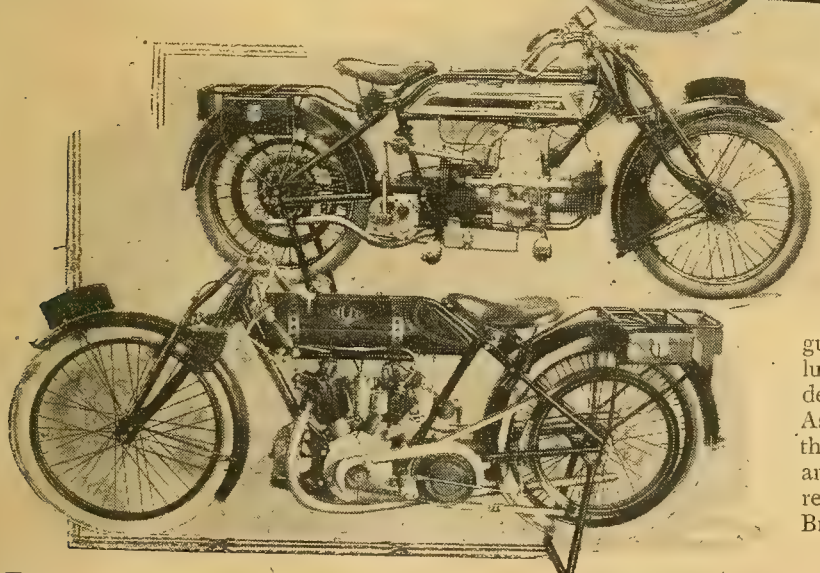
Dealing first with the firms who have never backed out, the Norton deserves special mention. This efficient long-stroke single, with direct belt or Philipson pulley drive, forms a combination of which only those who have ridden it can realise the fascination. With all-chain drive and countershaft gear box, the No. 16 Norton is also a fine example of the "go anywhere sports" type. Speaking without statistics, more leather helmets are worn by Norton riders than on any other two makes together!

Another belt-driven machine, the T.T. Rudge-Multi, although of fairly heavy build, is also essentially a sportsman's mount, and, with its pulling engine and high range of gears, it can get away from most machines of its class in the average friendly "blind." A redoubtable trio is completed by the inclusion of the T.T. Rover, now offered as a specially tuned speed model.



Two Flat Twins.

Of twins there are a few. Not often fitted with touring bars, the 3½ h.p. overhead-valved Brough may be obtained in one case with a guarantee of 60 m.p.h. —which, for a countershaft machine, is a striking figure.



Another very high efficiency flat twin is the new sporting Douglas, either in its 2¾ h.p. or 3½ h.p. guise. Here, too, overhead valves, lubrication, and combustion head are designed for maximum power output. As an indication of what we may expect, the 2¾ h.p.-engined mount has already annexed both sidecar and solo hour records in the 350 c.c. classes at Brooklands.

Nuts—

Last year, despite a very complete equipment, the N.U.T. was primarily a solo mount—and a fast one at that, but for 1921 the Newcastle firm has gone one better. The new six-valved

(Top) A genuine T.T. Scott—the new Squirrel model; and (below) the 3½ h.p. o.h.v. Dot which weighs but 196 lb.

(Right) Last year's T.T. winner in a modified form—the Sporting Sunbeam; and (below) the sensational Bradshaw-Zenith.

(Bottom) A cleanly designed o.h.v. flat twin—the 3½ h.p. Brough; and (below) the new six-valved T.T. model N.U.T.

The Sporting Solo Mount.—

twin is designed from steering head to rear hub on "hot stuff" lines, and the racing experience of the designer should ensure that it comes well up to high expectations. In appearance it is perhaps the most taking machine of its class on the road.

Also hailing from the north (if Manchester permits the designation), the two new solo Dot-Japs have the lines and the low weight that go to make up the "nippy" machine. The 3½ h.p. twin only weighs 196 lb., and certainly promises to *move*.

—and Squirrels.

The makers of the Scott, too, are entering the lists with a genuine T.T. product, very appropriately named the "Squirrel." Weight here has been cut down to a minimum (even the carrier has gone), but strength has not been sacrificed. And if the new Scott fails to get there by sheer speed—and, by the way, the maximum figure here is somewhat of an eye-opener—it will certainly get round a hairpin in less time than it takes to write about it.

Sunbeam performances in the T.T. augur well for the sporting model of that ilk—where again Antipon methods have been resorted to. A carrier and fairly ample mudguards are, however, retained, but an aluminium piston strikes the right note of the "revving" engine.

A Dark Horse.

Lastly, we have the new Bradshaw-Zenith. Both names indicate much to the enthusiastic follower of efficiency design: and the resultant product of the combination does not belie the hope. Yet untried against other machines, this super-scientific design cannot fail to figure largely in competition results next year.

There are others, too—many others, which are just over the border line of our self-imposed classification of "the purely sporting"—but, amongst those we have given, the solo enthusiast may spend many a pleasant hour deciding which is to carry his colours to victory. And what a scramble it will be round the Island in 1921.

Notes on the 1920 Six Days Trials.

Extracts from the Official Report recently issued by the Auto Cycle Union

ALTHOUGH the A.C.U. Six Days Trial was held during the last week in August, the judges' report was not issued until the eve of the Olympia Show. However, the tardiness of issue is balanced by the mass of interesting matter that it contains.

Somewhat startling is the statement that it was possible for a machine to gain a gold medal although entirely *hors de combat*. "This, in fact, actually did occur. One make alone had three machines with damaged engines, without the judges having any power to alter the awards otherwise obtained." Such looseness in the regulations is acknowledged, and should not occur in future events.

As was to be expected, there were more casualties among the smaller machines, but, contrary to what might be expected, Class A (up to 275 c.c.) has a better record than Class B (up to 350 c.c.). In Class A 71% of the starters finished, while in the old-established 350 c.c. class only 47% of the starters arrived at Brooklands, thus providing the class with the smallest percentage of finishers. It is, however, only fair to state that several of the well-known 2¾ h.p. machines were not represented at the trial.

Lightweights to be Encouraged.

Nevertheless, even the smallest machines entered demonstrated their ability to last through an arduous trial, and proved themselves to be capable of going anywhere.

In view of the rapid approach of taxation by weight, the report is worth its price if for the illuminating table of weights alone. Allowing that these figures are "all on" and not on the "stripped" taxation basis, it must be noted that only ten machines (all in the 275 c.c. class) turned the scale at under 200 lb. The judges strongly recommend that the A.C.U. should make special provision during the coming year for encouraging machines weighing, in touring trim, somewhere between 100 and 150 lb. This has been urged many times in *The Motor Cycle*, and we are glad to see our efforts are now bearing fruit.

In the run from Darlington to Thirsk, a distance of seventy-nine miles, the petrol consumption of several machines was measured approximately.

Some of the consumption figures recorded are as under:

	Approx. m.p.g.	
2¼ h.p. James	90	Petrol.
2¾ h.p. Levis	101	,,
6 h.p. A.J.S.	49	,,
7 h.p. Jime	53	,,
8 h.p. Matchless	58	Petrol and benzole
7 h.p. Matchless	45	,,

Silencer testing received much unfavourable comment at the time, especially regarding the accuracy of the audiometer. It is, therefore, worthy of note that the report states in almost every case the results obtained automatically by audiometer agreed with those noted by ear. Concluding their remarks on silence, the judges state that the absence of excessive noise was greatly appreciated by the general public throughout the trial, this being of valuable assistance in popularising the motor cycle.

Speed Test at Brooklands.

The inclusion of Brooklands as part of the "condition test," during which each machine travelling for thirty minutes at a speed determined by its class was satisfactory, but the judges consider that the duration of this test should be considerably increased in future. But few entrants had any difficulty in maintaining the scheduled speeds; in fact, the majority exceeded the set speeds by about 5 m.p.h., except those whose engines developed defects. This was the real object of this test, namely, to eliminate those machines which were on the verge of breaking down.

Brake tests were carried out on Brooklands test hill after 900 miles of riding under very severe conditions. The judges consider that the improvement in brakes is one of the most remarkable features of the machines taking part in the 1920 Six Days Trial.

Particular mention is also made of the performances of the following: Scott, Triumph, Velocette, A.J.S. (sc.), Levis, Matchless (sc.), Harley-Davidson, Humber (sc.), Dunelt, Beardmore-Precision, and Coulson.

The judges also desire to draw attention to the high state of mechanical efficiency of the machines which passed through the trials and were presented for their examination at Brooklands. Their condition was such as to bring the highest credit on British manufacturers as a whole.

Improvements made in brakes and silencers, and, above all, in engine performance, as exemplified by freedom from overheating, are highly satisfactory.

The judges consider that more attention should be given to cleanliness, streamline mudguarding, inertia of unsprung parts, silence, front wheel brakes, and sidecar wheel brakes (as operated by the passenger on the Humber machine).

Other points are ratchet brakes to hold sidecar outfits on hills when left unattended, low speed engine balance, lubrication of transmission, provision of detachable wheels with knockout spindles, large bearing surfaces to steering head, lower centre of gravity, greater convenience for oil filling, and larger screw greasers.

Tappet Clearances

A Semi-technical Discussion of Tappet Clearances based upon Technical and Theoretical Considerations.

By H. GEORGE HARLEY, Consulting Engineer, etc.

THE little space, or clearance, between the valve stem and tappet, or between the valve stem and rocker in the case of overhead valves, seems so small as to be of little importance to the general user of internal combustion engines. Although realising the necessity of clearance under all conditions, the average rider does not always rate at its proper value the importance of the *amount* of clearance.

The Importance of Clearance during Designing.

In order to give the average user of petrol engines some idea of the importance of tappet clearance adjustment, it is well at the beginning to point out that this little space between valve and tappet, amounting very often to only five or ten-thousandths of an inch, is fixed upon by the expert technical designer only after extensive and complicated mathematical calculations of running speeds, heat losses, cooling efficiency, expansion of cylinder, valve stems, etc. After fixing a figure for the clearance, this is used in conjunction with figures governed by the speeds, valve areas, lifts, speeds of gases, rate of valve closing, spring strength, and rate, etc., in designing the cam. Now, although a cam is apparently such a simple thing, the calculations for the cam profile call for a high degree of mathematical knowledge and a knowledge of all matters connected with the thermal efficiency of the engine, its probable performance, etc., in addition to the other matters outlined above. During the cam calculations the numbers used are often less than one-thousandth, being in the form of a decimal of five or six figures, and used in conjunction with mathematical knowledge only possessed by a highly trained engineer.

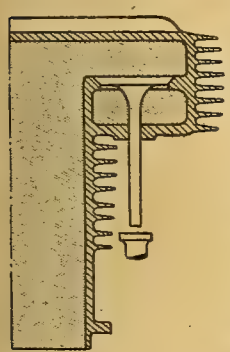


Fig. 1.

A consideration of the above information is worth while, because it shows that, if the calculations are based upon a tappet clearance of, say, five-thousandths of an inch, and there is an error of a mere five-thousandth in the adjustment, the clearance, being ten-thousandths, will obviously be twice as large as the clearance upon which all the above-mentioned calculations were based.

Although the actual calculations, which would be highly interesting to an engineer, could be given here by the writer, it is proposed only to give such figures as may be necessary to allow the "every day motor cyclist" to see the main points of importance of the subject.

In the first instance, it is well to go into the subject of heat expansion, and to deal with some points not well known among users. The average rider is quite aware that an exhaust valve increases in length when heated, and that this increase in length should always be less than the clearance allowed in order to have "hot" clearance.

Now there are other considerations to be taken into account that depend *entirely* upon the individual design or type of engine.

For instance, to discuss the case illustrated in fig. 1, the clearance is shown exaggerated; if the exhaust stem be increased in length, due to heating, the stem would take up a considerable amount of the clearance by extending in a downward direction; in addition to this, however, the cylinder, becoming heated, would extend in an upward direction. If therefore

e_1 = expansion of valve,

e_2 = expansion of cylinder (up to height of valve seat),

C = cold clearance

we have $C_1 = C + e_2 - e_1 =$ "hot" clearance ... (1)

It will be seen in this case that the amount of clearance is decreased by an amount equal to the expansion of the valve, and is increased by an amount equal to the expansion between the valve seat and bottom of flange of cylinder.

The Care of the Inlet Valve.

Now the inlet valve is a different matter; in this case the cylinder, of course, is expanded when hot, but the stem of the inlet valve may be quite cool or, at any rate, not at a temperature to be compared with the exhaust valve. The inlet valve clearance may therefore increase a little or remain at about the same figure when running or stationary. It is probable that in most engines the inlet valve *mean* temperature is somewhere about equal to the mean temperature of the cylinder *barrel;* the variation in clearance would therefore not be great. It should be noted that the clearance when cold may not be the same for both valves, but the difference in working conditions of the two valves may yet have been allowed for when designing, and the hot clearances would therefore be equal.

The conditions of expansion with overhead valves are a little different from those of the older valve

Tappet Clearances.—

arrangements, and when the valves are operated by rockers, as shown in fig. 2, these have the effect of complicating the action of expansion.

With rocker-operated overhead valves, the expansion of the valves may be assumed to be as before explained, but in this case, in addition to the valve and cylinder expansion already discussed, it is necessary to take into account the effect of cylinder expansion upon the height of the rocker pivot.

Cylinder Expansion and Overhead Valves.

The comparatively slight heating of the rocker bracket itself may usually be neglected, therefore the amount of lift of the rocker pivot, due to cylinder expansion, depends almost entirely upon the amount of expansion between the cylinder base and the base of the rocker bracket.

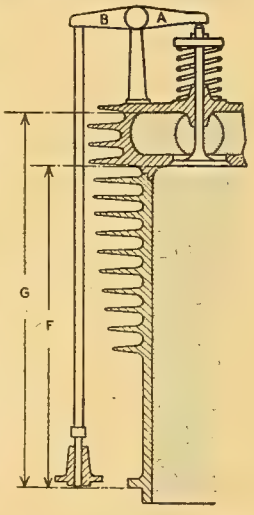

Fig. 2.

As the base of the bracket is not necessarily always placed at the same height as the valve seating, the height of the former usually has to be considered quite separately from the latter.

In the second case, illustrated by fig. 2, both valve and cylinder expand in the same direction, and the action of each has a reducing effect upon the clearance; on the other hand, expansion of the cylinder increases the height of the rocker pivot, and this has the effect of increasing the clearance.

In addition, the ratio of the arm A to the arm B of the rocker has an effect which may be best illustrated by fig. 3. In the figure the arms are equal, and therefore a lift of $\frac{1}{40}$ in. of the cylinder would lift the pivot $\frac{1}{40}$ in. Now, supposing the valve stem to remain stationary, the point where the push-rod is connected would lift twice $\frac{1}{40}$, equal to $\frac{1}{20}$ in. It happens, however, that the valve also lifts, and if the cylinder expansion lifted the valve $\frac{1}{40}$ in. as well as the pivot $\frac{1}{40}$ in., the clearance would be only increased $\frac{1}{40}$ in.

It should be clear from this that any lift of the pivot causes a lift at *both* ends of the rocker, and the corresponding lift of the valve, due to cylinder expansion, only takes up the clearance at *one* end of the rocker; the push-rod, always being cool, does not expand, therefore the increased height of the push-rod end of the rocker causes an increase of clearance.

An understanding of the preceding principles is necessary in order to see clearly that with overhead valves the tappet clearance adjustment is even more important than with the ordinary type, although both types require exact adjustment.

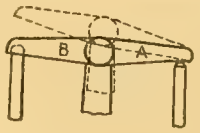

Fig. 3.

Referring to fig. 4, it should be evident that with A twice as long as B, an error of the adjustment of the clearance at S would mean an error of twice the magnitude at T.

The foregoing will show how little errors of adjustment may be multiplied or caused to have far-reaching effects on the running adjustments, out of all proportion to the error.

Fig. 4.

Having described the heating and expansion effects upon the two most usual types of valve gear, it is necessary to examine the effect of clearance errors upon the timing of the engine. The errors in timing caused by incorrect tappet clearance are not well known, although of great importance.

The cams of internal combustion engines are made to a variety of designs, but as the following remarks apply to all valve gears, reference may be conveniently made to the "tangential-faced" type of cam. In fig. 5, when the point of the cam profile, crossed by line H, is in contact with the tappet roller, the tappet commences to lift, but the valve begins to move when the point on the profile coincident with line I is in contact with the roller.

The reason why the clearance angle does not vary directly as the lift, but only *almost* as the lift, is that the angle Z does not vary at a regular rate.

As differences of clearance cause the above-mentioned variations of clearance angles, the angle S is therefore reduced by increase of tappet clearance, and is increased by reduction of tappet clearance. As angle S represents the *valve* lift period, it will now be understood what an enormous effect incorrect adjustment of tappet clearance has upon the valve timing and therefore the running efficiency.

Wrong Tappet Clearance and Unsatisfactory Running.

Improper tappet clearance has many strange effects upon running, and it should be noted that the ill-effects, like most ill-effects of bad "timing," are most serious when the engine is going "all out." The writer has made an increase of as much as 8 h.p. upon a certain type of aero engine during experimental tests by merely altering the tappet clearance about two "thousandths," and has also increased the horse-power of a well-known engine by nearly 18 h.p. by redesigning the cams, the slight variation made in the design being much less in its effects than many errors of tappet adjustments common in smaller engines.

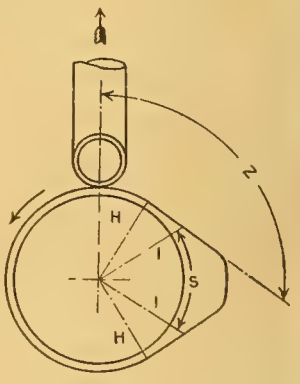

Fig. 5.

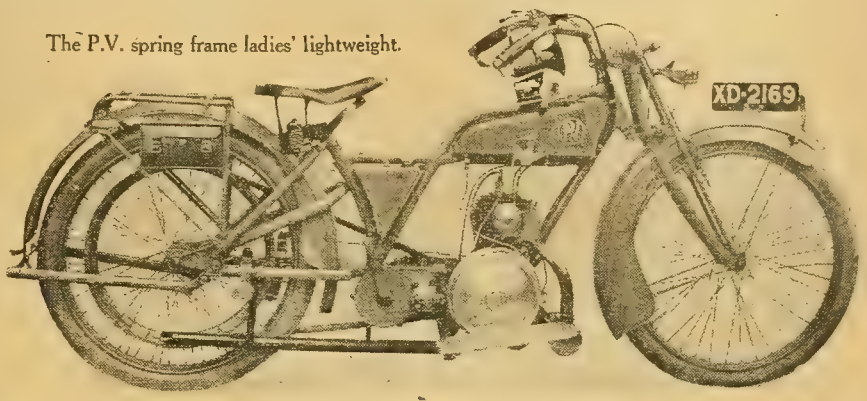
It is the knowledge of these "sensitive" points in poppet valved engines which causes some designers to turn their attention to sleeve and rotary valves, but it is interesting that up to the present the most efficient engines are of the poppet valve types.

A Spring Frame Lightweight for Ladies.

P.V. Machines for 1921 marketed with Open or Diamond Frames.

ONE feature of the 1921 models is that every class of rider is catered for. A large number of ladies' models have again appeared, and, without doubt, will not fail to attract those members of the gentler sex who have objected to riding a machine with a frame designed for the other sex. One fair critic at Olympia complained that there were no ladies' machines with spring frames, yet just outside Olympia she might have found such a machine in the P.V., now made in the two types illustrated on this page. A clutch and kick-starter are included in the specification of the lady's model.

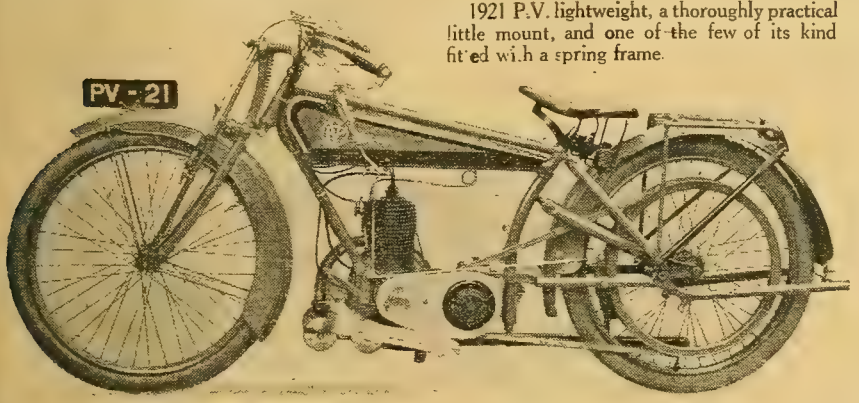
The P.V. spring frame ladies' lightweight.



A Distinctive Detail.

There are few more practical lightweights with modern refinements than

1921 P.V. lightweight, a thoroughly practical little mount, and one of the few of its kind fitted with a spring frame.

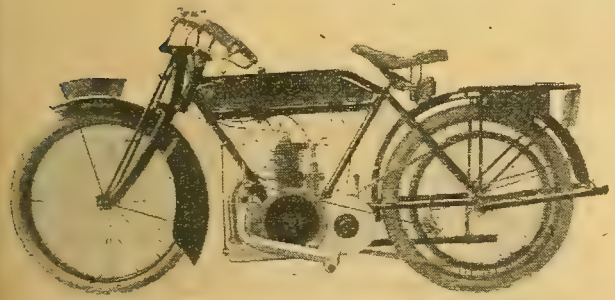


the 2½ h.p. P.V., which is fitted with one of the earliest and most satisfactory forms of rear springing yet devised. As may be remembered, the adjustable springs are enclosed in the frame tubes. Another distinctive detail is an easily detachable rear wheel, which may be removed without disturbing the brake. A 2½ h.p. Villiers engine supplies the motive power. The flywheel magneto control in this case, however, is from the handle-bar.

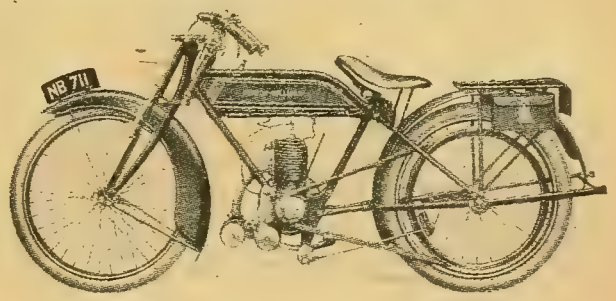
Both models are fitted with Brampton Biflex forks, which, combined with the rear springing, provide a degree of comfort not often found on so small a machine. A fairly long wheelbase should also be conducive to smooth running, and makes for great accessibility in both gear box and engine location.

Two Lightweight Two-strokes.

A 350 c.c. Two-stroke and a Smaller Machine that Sells at a Popular Price.



Ample power for solo or light sidecar work is provided by the 350, c.c. Broler engine fitted to the Spartan.



One of the cheapest machines on the market, the 2½ h.p. Newton-Villiers, which sells at well under £50.

NEARLY fifty motor cycle manufacturers exhibited two-stroke lightweights at Olympia, but this number does not represent the total number of makers offering this type of machine. Many were unable to take their models to Olympia, and among them were the two machines illustrated above.

The Spartan 350 c.c. Lightweight.

Previously known as the Welland B. and the Broler, the Spartan is essentially the same machine under a different name. A 350 c.c. Broler two-stroke engine is utilised as power unit, driving through an Albion two-speed gear box with clutch and kick-starter. Double-row ball bearings are fitted to the countershaft and big end of this engine, which is a cleanly-designed two-stroke of the conventional three-port type. Band and belt rim brakes both act on the rear wheel. A light sidecar outfit to the same specification is also marketed. Although not very familiar in open competitions, the Spartan made a commendable performance in both the Leicester two-stroke trial and the more recent Leicester M.C.C. Pascall Cup event. The concessionnaires are Messrs. Wallis and Jannes, of Nottingham.

The Low-priced Newton-Villiers.

One of the only lightweights proper that does not possess some form of gear changing mechanism, the Newton sells at the remarkably low figure of £48. As the name implies, a Villiers flywheel magneto engine is fitted, and it may be stated that the other components are of the same high-class order. It is marketed by Newton Bros., Levenshulme, Manchester.

CAR PRACTICE IN MOTOR CYCLE DESIGN.

Points in which the Example of the Larger Machine is being followed by the Smaller. Suggestions for Still Closer Unification of Principles of Design.

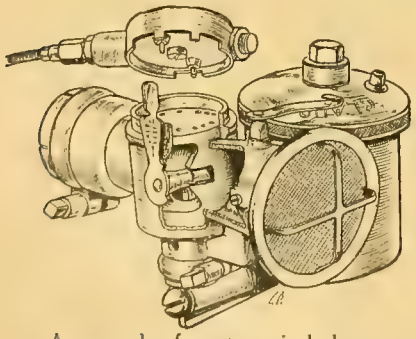
By CRITICUS.

This article is frankly written from a car owner's point of view, and while motor cyclists will not agree unanimously with all the points referred to, nevertheless the views expressed are of interest as coming from a member of "The Autocar" staff.

TO one more intimately connected with the products displayed at the Automobile Show, the Motor Cycle Exhibition at Olympia came as a refreshing tonic. In place of the somewhat detached and rather bored air of both car seller and buyer, one immediately plunged into an atmosphere of enthusiastic sellers and amazingly candid and critical buyers. Indeed the candour of some of the motor cycle purchasers was amazing. Perfect strangers advance on the designers themselves, and without preamble roundly assert that the design of such and such a part is "rotten." Mark you, they do not say that the design is incorrect in their opinion, or that it is open to improvement—it is simply, plainly and imbecilely "rotten!" It would appear that no personal reflection is intended, but it merely betokens an amazing keenness and absorbed interest on the part of the motor cycle using public.

One is tempted to wonder, in face of this prevalence of massed attack criticism, that motor cycles, as regards the design of their main components, the engine, gear box, etc., have not advanced upon more car-like lines than has been the case. One would have almost thought that the very enthusiasm and candour of buyers and users would have impelled manufacturers for very shame to have discarded all old-fashioned practice as not likely to appeal to such a discriminating public.

One is forced to the conclusion that either the practice followed in the design of the average motor cycle, although, perhaps, old-fashioned, provides extraordinary reliability, or else manufacturers as a whole are case-hardened against criticism. Any way, it was very refreshing for a car user to find himself in the midst of this seething mass of enthusism, which was to be found any day at Olympia during the progress of the Motor Cycle Show. Nor was such critical enthusiasm confined to the younger and, presumably, more enthusiastic type of motor cyclist; quite steady paterfamilias types of buyer were apparently similarly affected.

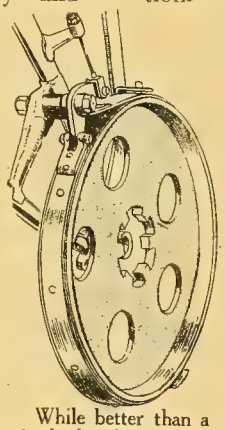


An example of car type single lever carburetter—the Claudel-Hobson.

If one is asked how motor cycles have gradually followed car practice and what degree of finality they have reached in this matter, one is confronted with a poser.

Car Features.

Detachable wheels, dynamo lighting, external flywheels, internal expanding brakes, sliding type gear boxes, mechanical lubrication, automatic carburation and even pressed steel frames, may all be mentioned as items used in the design of both cars and motor cycles. But when one has said this one has practically said everything. Practically all these items are ordinary everyday part and parcel of a modern car's equipment. On motor cycles many of the items are still the exception. To a motorist, there is something extraordinary that some of the details enumerated have not been clamoured for till they have been embodied as standard practice in the design of high grade motor cycles.

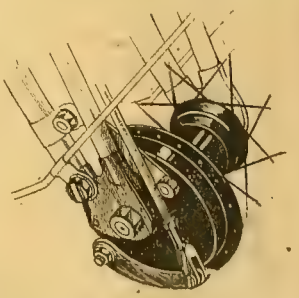


While better than a rim brake, the external contracting type suffers from its exposed position.

Surely the very fact that the mechanism of a motor cycle being continually exposed to mud, dust, and wet, in a way that no car engine is ever exposed, confirms the *prima facie* case for, as far as possible, embodying what one may term the principle of "automaticity" in its design. It is a horrible job mending tyres; everyone wants detachable wheels. It is terrible work wrestling with evilly disposed acetylene generators. Anyone who has ever used dynamo electric lighting would, like the tramp in the soap advertisement, never use any other. The silence, cleanliness, and general reliability of the internal expanding brake—a type practically universal on cars—are so satisfactory that one cannot imagine the use of any other type on the exposed-to-weather motor cycle.

Again, why are inside flywheels still clung to by the majority of motor cycle engine makers? Mechanically there is everything to be said against their use, and everything to be said in favour of the outside flywheel. Why make the engine drive the flywheels through a sea of oil?

With regard to pressed steel frames, it may be a debatable point as to whether the tube frame is not perhaps more satisfactory from a manufacturing point of view, but if the motor cycle for the million—in other words, a motor cycle Ford—is ever to appear, it will have to be a repetition job capable of being repeated in vast numbers for years



In the internal expanding brake the shoes are protected from mud and wet.

THE SECRETS OF SUCCESS.

How Thousands of Men and Women Have Won Their Way to High Positions in Life.

ONE often hears the question asked, "What is the Secret of Success?"

The answer might very well be given: "There is not one secret but many."

For Success in life does not depend upon the possession of any one particular quality. Many different qualities are required, and it is the combination of these qualities that proves irresistible in the combat and competition of Business, Industrial, Professional, and Public Life.

Fortunately, most people can acquire these qualities if they try, as the facts given in this page show.

Lord Ashfield's Opinion.

Lord Ashfield, for example, speaking of the qualities necessary in business management, says that the head of a large business requires:

—Judgment,
—Enterprise,
—Resolution,
—Prudence,
—Fortitude,
—Tact
and Sympathy.

Now these qualities—and many other qualities of the utmost value to a business man or woman—can be developed by training the mind on scientific lines, as everyone who practices Pelmanism knows.

And this being the case, it is not surprising to find Manager after Manager writing to say how much Pelmanism has helped him in his work.

"Doubled My Turnover."

One manager, for example, says that as the result of Pelmanism—

"I doubled the turnover of my department last year. This year I am doing better than last. I am always originating new ideas, and have a vivid and well-disciplined imagination."

Another Manager states that he owes his present position "entirely to the results obtained from the Pelman Course." A third business man says that he was in the rut "for twenty-two years." Then he began to Pelmanise and was given more responsible work. Now he, too, is a Manager. Yet another correspondent says that when he was demobilised at the end of the war he became a Commercial Traveller. He also took up Pelmanism. To day he is the Managing Director of a successful business. "I attribute my success," he says, "mainly to the results derived from your excellent Course." Further, he adds, "If you will refer any dubious cases to me I shall be happy to convince them of its advantages."

"Be Resilient," says Lord Riddell.

Another point of view—and a very important one—has been expressed by Lord Riddell. In his opinion, one of the most valuable qualities a business man or woman can have is that of Resilience. Many people fail utterly and entirely because they do not possess this quality. Defeat knocks them out. It crushes them so that they never rise again. To such people, he says, "failure comes as a staggering blow from which they never recover." "If a man fails and sits down under failure," he continues, "the world will kick him off his chair." But the man who ultimately succeeds is the man who gets up again "and makes another attempt." This is the man who does not lose confidence in himself under the blows of Fortune. He has Resilience. He has pluck. He has Self-confidence. And in the end he wins. "The man who is able to resist the effects of failure and disappointment and to concentrate his full attention on the next step," says Lord Riddell, "is likely to succeed in the end, whereas the man with weak powers of resistance will probably buckle up."

The Self-confidence that Wins.

Here again is a point where Pelmanism scores heavily. Pelmanism gives you Self-confidence. It banishes Depression, Weakness of Will, Nervousness, and the Fear of Failure. It gives you courage and assurance. It gives you that confidence which comes from the knowledge that your mind is trained, alert, and capable. It gives you the ability to Master your surroundings and to rise superior to your difficulties. And thousands of men and women have found this to be the fact, and have blessed the day when they first took up Pelmanism, and found that it gave them the Confidence in themselves that wins the confidence of others. "Whilst our chief accountant," so runs a letter recently received by the Pelman Institute, "who secured me the post, is unaware that I am a Pelmanist, I think I may truthfully say that I may thank the Pelman principles for the Self-confidence which enabled me to suggest that I should be entrusted with the work."

Seizing Opportunities.

Another secret of Success is the ability to seize opportunities. The world is full of opportunities. They come to everyone. They are always coming. But only a few make use of them and so find out how valuable they are. Pelmanism makes your mind alert so that you seize one opportunity after another instead of letting them slip by. "From a salary of £195 in August, 1918 (the time I completed the Course)," writes a Yorkshire Wool Dyer, "I rose in one step to £400, and in January this year to £800 per annum. I do not pretend that Pelmanism made the opportunities, but it certainly taught me how to make the most of them when they did come."

Concentration, Memory and Personality.

Concentration is another secret of Success, just as Mind-wandering is one of the causes of failure. If you concentrate well you can master any problem and perform any task in half the usual time. Yet another valuable quality is Retentiveness—the possession of a reliable Memory. Of what value is any knowledge or experience if you cannot remember it—if you forget? And yet another factor in Success is Personality, which is really the result of developing all the other qualities mentioned. Successful men and women are men and women with Personalities. They are Personalities because they are efficient. Inefficient men and women have weak personalities. They are shadows drifting through life. Here is a letter from a man who has developed Concentration, a good Memory and Personality all through Pelmanism. He is a joiner's apprentice, and this is what he says:

"Eleven months after taking up your Course finds me a different man. Concentration has been gained, my memory has been improved from Moderate to Good, and all my Perceptions greatly strengthened. Your Course is one which is suitable for persons of all temperaments, and, apart from all monetary gains, it gives that developed mentality and personality which is beyond price."

"More than Trebled My Income."

One of the results of developing these qualities is that Pelmanists are enabled to double, treble, and even quadruple their incomes. Hundreds of such cases could be quoted. A Clerk writes: "Since taking up the Course I have more than trebled my income, which is due solely to your teaching." An architect says: "Since I commenced your Course my efficiency has vastly increased. My income has gone up 300 per cent. I attribute all this to the Pelman Course." And similar letters have been received from men and women all over the world, engaged in almost every occupation that could be mentioned.

Readers who would like to know what Pelmanism will do for them should make use of the Coupon printed below. Post it off to-day, and by return they will receive, gratis and post free, a copy of an interesting book on Pelmanism, which will show them how thousands have mastered the secrets of success and won their way to prosperity and happiness.

Use this Coupon or a Postcard (or Call) To-day.

TO THE PELMAN INSTITUTE,
199, Pelman House, Bloomsbury St., London, W.C.1.

Sir,—Please send me, gratis and post free, a copy of the book, "Mind and Memory," a copy of "Truth's" Special Report, and an enrolment form entitling me to take the New Pelman Course on reduced terms.

Car Practice in Motor Cycle Design.—

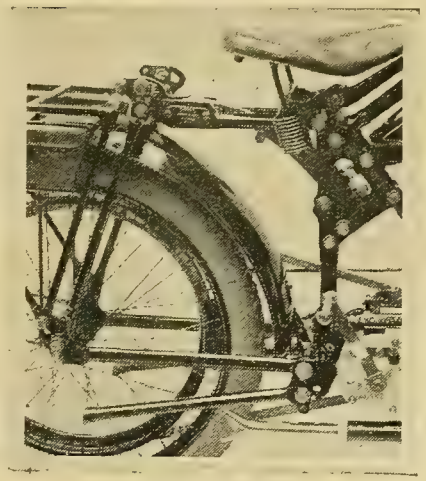
at a stretch. Whenever that happens there is no doubt whatever that such a machine will be equipped with a pressed steel frame, purely for the sake of cheap manufacture.

One now comes to two enormously vital points in the design of motor cycles, and points where it seems to the writer there is no possible excuse for not following car lead. These two points are expressed under the headings of "Mechanical Lubrication" and "Automatic Carburation."

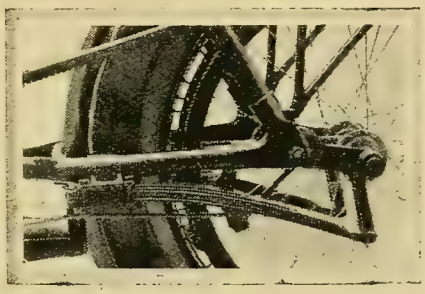
Lubrication.

Let us first consider the question of lubrication. One is glad to see that a few makers are following the lead of America in providing some sort of pump for circulating the oil, though one cannot recall that anyone carries out a complete forced feed lubrication system. By this I mean the provision of a proper sized oil sump and a circulation of all moving parts right up to the little end by means of a pump. This was done some years ago on the W. and D. engine, and it seems a thousand pities that that excellent lead has not been followed. First-class lubrication is more than ever necessary in these days of heavy sidecars. It would appear to be still a generally true criticism to say that the average motor cycle engine is over-oiled half its time and under-oiled the other half. The result is that the oil consumption on most motor cycle engines is inordinately heavier proportionately than on most car engines. The 40-50 h.p. Rolls-Royce engine does 1,200 miles per gallon of oil. How many motor cycle passenger outfits can come near that figure? One has only to think of the length of time it is possible to run the ordinary small car engine fitted with a proper form of lubrication without removing the carbon, compared to an average motor cycle engine. Most people put this down to the difference between water and air-cooling. The writer totally disagrees and feels convinced that it is the usual motor cycle system of 50% over-oiling coupled with 50% under-oiling that causes such comparatively enormous and frequent hard baked carbon deposits on most motor cycle pistons and cylinder heads. There is real work for designers in this direction, and it is to be hoped that the future will see less apathy on their part in this important matter.

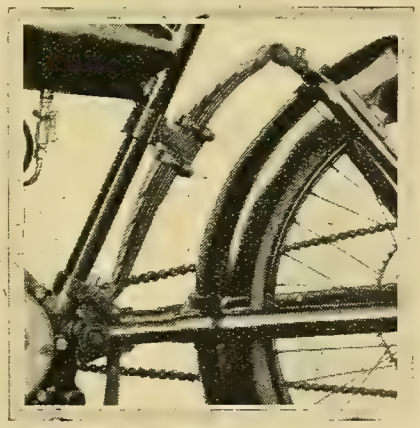
CAR TYPE SPRINGING ON MOTOR CYCLES.



ROYAL RUBY



COULSON.



BEARDMORE-PRECISION.

Although our contributor is a car engineer he appears to favour coil springs for motor cycles, yet very few cars embody them. Three different types of motor cycle rear springing systems utilising leaf springs are shown above. The Royal Ruby may be said to consist of two frames connected by a leaf spring; The Coulson is a spring wheel, and has proportionately less unsprung weight than most cars. The Beardmore-Precision is a compromise of the two extreme types, as the springing does not necessitate the extra parts excepting the spring itself.

Carburation.

We now come to carburation. The average carburetter fitted to a motor cycle is equipped with two levers to regulate the amount of gas and air entering. For some reason or other, the majority of motor cyclists appear to distrust the one lever automatic carburetter. It is true that an ancient jest was made to the effect that an automatic carburetter provides an incorrect mixture on all speeds. This may once have been the case, but it has long since ceased to be so. Probably the average non-automatic carburetter of to-day gives a far more incorrect mixture in the hands of the ordinary user than does the automatic instrument. The very fact that the handle-bars of a motor cycle are subjected to far more vibration than is the steering wheel of a car goes to prove the extreme difficulty of correctly choosing the positions of two levers. It is not even the case that the provision of two levers gives really good fuel consumption. There is only one correct way to measure consumption of fuel, and that is in ton miles per gallon. Contrasted with the results obtained on most cars the ton miles per gallon achieved on most motor cycles is nothing short of a scandal. This then would appear to show that there is little good to be said of the non-automatic carburetter. It is good to see, therefore, that quite a move in favour of automatic carburetters was noticeable at this year's Show. There is now an excellent range of motor cycle automatic carburetters on the market, and it is fairly safe to prophesy that these will attain greater popularity as time goes on.

It is sometimes said by manufacturers of two lever carburetters that the air lever is used only for shutting off the air for starting. One can hardly accept this as any excuse for providing a couple of yards or so of Bowden wire, which, to say the least of it, does not improve the clean appearance of the handle-bars, when the carburetter itself might be equipped with an air strangler operated by a lever half an inch long.

Brakes.

With regard to brakes, one is unfeignedly glad to see that the

Car Practice in Motor Cycle Design.—

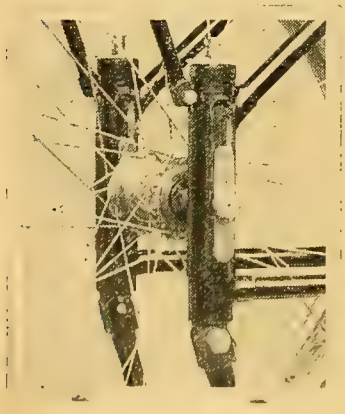
expanding type of brake both for front and rear wheels is gaining popularity. The old front wheel rim brake never was a great deal of use. The front wheel dummy belt rim type of brake could be made to function excellently, but it was generally ugly. To car users, the equipment of motor cycle wheels with large diameter extra rims upon which the brake shoes might work has always appeared as an example of strange and ragged designing. Motor cycles for years have been simply crying out for internal expanding hub brakes as used on cars, and it appears likely that at last these are in a fair way to become general. Of external band brakes on motor cycles the less said the better. They are indifferent on cars; on motor cycles, owing to their very exposed position, they are deplorable.

In their Favour.

If motor cycle designers are still more or less groping in the dark in their efforts to follow car practise, there is one point in which the smaller vehicle has the larger one guessing. This is in the matter of ease of gear changing and clutch manipulation. Nearly all cars are equipped with clutches that require relatively more effort to disengage by foot than does the average motor cycle clutch by hand. This is distinctly a feather in the cap of the two-wheeler. Nor can one think that on any car is it possible to change gear with such consummate ease and complete silence as it is on practically every motor cycle.

Gear Boxes.

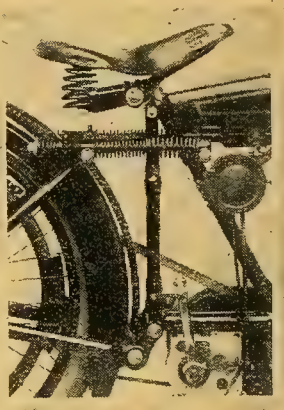
Designers of gear boxes for motor cycles have not stood still, and have been particularly praiseworthy in their efforts to eliminate unnecessary parts and reduce weight. One feels, however, that a good many gear units could with advantage be cleaned up as regards the exterior, many of them having too many crevices in which oil, dust, and mud become entrenched. A smooth exterior is a hall mark of good car component design—motor cycles need this "touch" sadly. It is also strange that more effort is not made to embody the engine and gear box in a single unit—a practice so largely prevalent on motor cars.



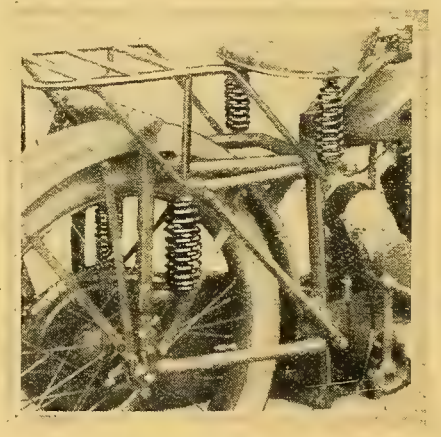
The Wooler springing system, like the Coulson, reduces unsprung weight to a minimum. It employs coil springs.

The car driver visiting the Show was at first glance almost tempted to enquire if the solo motor cyclist had ceased to exist. Except as regards the riders of lightweight machines, the Show was essentially a passenger vehicle show. Runabouts and sidecars of all shapes and sizes and degrees of equipment were everywhere—in fact, to see a stand of purely solo machines other than obviously small lightweights was a rarity.

The time appears to be ceasing to be when motor cyclists will be classed as solitary individuals. Even some of the smallest machines, although destined by their makers to run as solo mounts, are not to be exempt from the hand of the sidecar makers because dotted about the Show were many examples of miniature sidecars plainly announced as designed for lightweights. It is an agreeable testimony to the excellence of material generally used in the construction of both the motor cycles and the sidecars that one sees so very few of such light outfits in trouble by the roadside.



Coil springs in compression is the principle of the Hobart frame.



In the Matchless system, coil springs are used in compression.

Spring Frames.

In the matter of springing the motor cycle industry is evidently waking up. It is a very difficult problem to spring cars well. Much more is it difficult to follow suit with so light a vehicle as a motor cycle. Still, serious efforts are being made, and it is something to find a general realisation on the part of designers that the vertebræ of those riding *on* motor cycles and those riding *in* cars are similarly constructed. Whether the leaf spring is quite the thing for motor cycle suspension may be doubtful—the spiral spring has excellent attributes—but at all events one may be thankful the designers have gone so far as openly to confess that motor cycles, just like cars, need suspension systems. We are getting on.

There is one final point in which some sidecar outfits are following car practice a little too closely. This is in the matter of price. When one sees several firms listing outfits at a price which, out of three hundred pounds, leaves only about enough to fill the tank, one is forced to wonder how long such propositions will remain. It is shocks such as this that make the success of many three-wheeled runabouts and four-wheeled cycle cars assured. The *drivers* of the latter type—three or four-wheeled—keep dry and clean. Car drivers—however cheap the vehicle—keep dry and clean. *De luxe* sidecar outfits will simply *have* to follow this practice sooner rather than later. One wonders if Mr. Alfred Scott has pointed out the way.

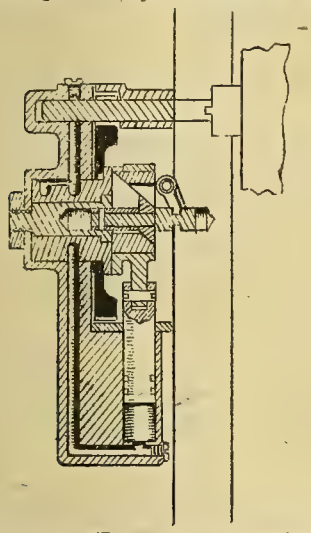
A Throttle-controlled Mechanical Lubricator.

Describing a Simple Oil Pump which Proportions Supply to Engine Load.

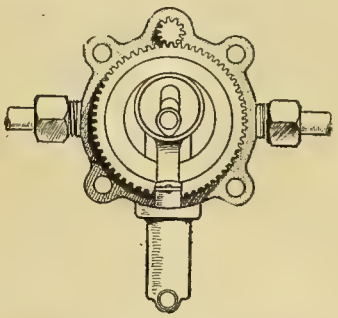
DIFFICULTIES in the way of mechanical lubrication for motor cycle engines usually arise from a fear of complication and the unreliability of small spring-operated ball valves, which have proved troublesome in the past.

In an effort to eliminate these faults, Mr. A. Turner, of 6, Lincoln Street, Old Basford, Nottingham, has produced a device having a positive rotary valve operated by the same drive from the timing gear which operates the pump plunger; the latter is given a variable throw dependent on the amount of throttle opening.

The apparatus consists, essentially, of a case (attached to the timing gear cover of the engine) from which depends a cylinder, wherein reciprocates a pump plunger operated by an eccentric driven



Section of the Turner oil pump attached to the timing gear of an engine.



Plunger, eccentric, and driving gear of the Turner oil pump.

by an 8 to 1 reduction gear off the camshaft. The amount of eccentricity of the driving disc, which runs within the pump connecting rod strap, may be varied by moving an actuating rod horizontally through the agency of Bowden mechanism interconnected with the throttle. On the actuating rod is a cylindrical section at an angle of 37° to the horizontal, and this slides in a hole bored through the disc at a similar angle. It will be seen that, according to the horizontal location of the actuating rod, the throw of the disc will be varied from zero to a maximum.

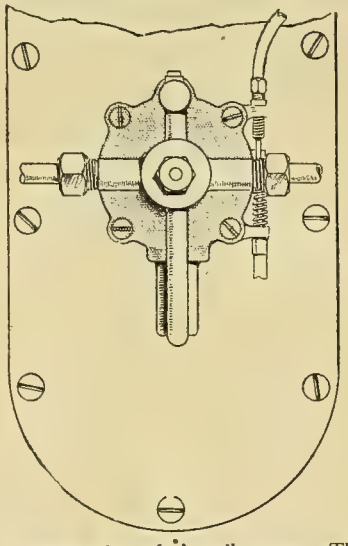
Rotary Distribution Valve.

The pump cylinder is connected by a passage to a chamber, in which rotates the controlling valve. The latter runs on a fixed stud concentric with the pump eccentric actuating rod, and drives the eccentric itself through the medium of a self-adjusting sliding tongue and groove arrangement on the abutting faces of the two parts.

On the periphery of the rotating valve are two grooves connected by a transverse slot. One of the grooves registers with the passage communicating with the pump cylinder, while the other, which only extends round half the circumference, registers with the suction and delivery pipes.

In operation, the half groove uncovers the suction pipe as the pump plunger ascends, thus sucking oil from the tank; on the down stroke of the pump the delivery pipe orifice is uncovered, and the charge of oil forced to the engine.

Advantages claimed for the arrangement are: (1) No screws in assembly of working parts, (2) entire mechanism running in oil, and (3) pump piston gudgeon pin secured by split ring. The inventor assures us that the running on his own 3½ h.p. Premier machine has been very satisfactory, from the point of view of both consumption and absence of trouble.



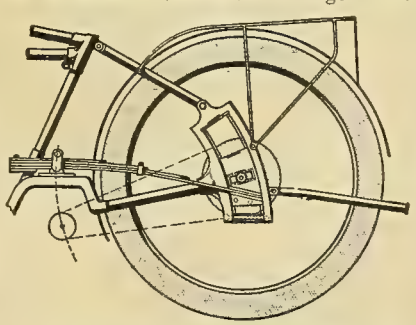
Exterior view of the oil pump. The delivery is controlled by Bowden wire interconnected with the throttle.

A NEW TYPE OF REAR SPRINGING.

AN ingenious system of springing a motor cycle, retaining a constant transmission tension, has lately been brought to our notice. The rear wheel is suspended on quarter-elliptical springs, which are held in a special lug on a horn plate sliding in guides at the base of the rear forks. Actually the horn plate slides in flanges, preventing any lateral movement of the wheel relative to the frame, and rubber buffers are placed top and bottom to take any extra violent shocks which may be received due to an exceptionally bad pothole. The guides are curved in arcs of circles struck upon the centre of the final transmission system, so that the same chain tension is retained.

At the top of each guide there is a lug, and on the top of each horn plate there is another lug. Both these are drilled for the reception of a bolt, so that, in the event of a spring breaking, the frame may be locked solid, and the rider can continue his journey home. Slots are provided in the horn plates for the adjustment of the chains.

Each spring is attached to the frame by a strap acting as a fulcrum. The wheel is easily removed by withdrawing the bottom bolt and rubber pad from each guide, and removing a pin from the side of the strap, so that this side can be turned down about a hinge. The spring may then be pivoted outwards from the wheel, allowing the horn plate to drop out of the guides.



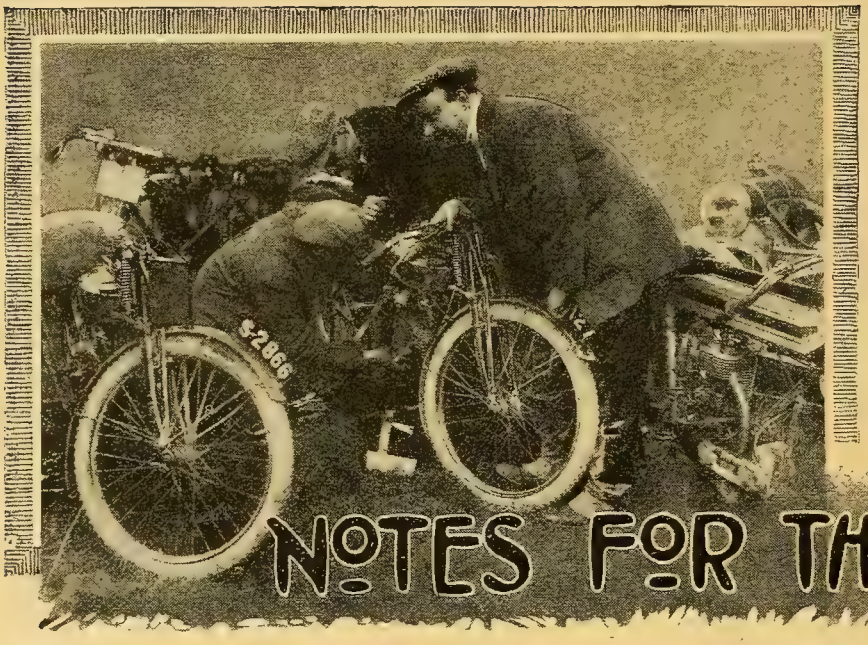
Belt or chain tension is kept constant with this system of springing, although no hinged members are used.

The rear stand is so designed that the guides are not obstructed by the stand-supporting lugs.

The system is adaptable to most motor cycles with rigid frames; and, where the countershaft sprocket and rear wheel are moved fore and aft for chain adjustment, the strap supporting the spring is mounted on the frame so that it can also be moved until it is in the same position relative to the countershaft. The arrangement reduces unsprung weight, prevents lateral movement of the wheel, and eliminates hinged joints in the rear of the frame, while the life of the transmission gear is claimed to be increased.

The inventor is Mr. G. H. Durston, of W. Henderson Gray's, A.M.I.M.E., 8, York Place, Baker Street, London, W.1.

Mr. Durston is also producing a side-car chassis sprung in a similar manner, but using vertical guides in lieu of radial brackets.



THE LIGHTWEIGHT—ITS POSSIBILITIES AND REQUIREMENTS TO ENSURE CONTINUED EFFICIENCY.

NOTES FOR THE NOVICE

IT commonly happens that the lightweight machine of moderate or low power is the first choice of recruits to the ranks of motor cyclists, and this is just as well, not because a heavier or more powerful machine is more difficult to ride or to keep in order, for this is by no means the case, but for the very good reason that a lightweight is far more easy to handle when the rider is not in the saddle. A heavy machine when taken off its stand is apt to pull its unwary owner over—I am assuming for the moment that the owner is a novice and not accustomed to handling anything heavier than a *push* bike (for the use of this term I hereby tender my humble apologies to all pedal cyclists)—or to knock him down, and lie upon him, dribbling petrol and oil the while over his best leather coat and mustard coloured waistcoat. It is very true that a heavy machine takes careful handling, and the new owner of one should always be careful to keep it leaning slightly towards him, whereas a lightweight is more amenable to discipline, and not likely to get out of hand.

Two or Four-stroke.

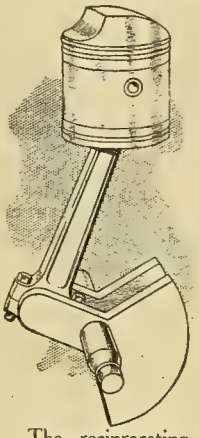
The novice then having been guided by my sage advice, though not given in so many words, and having decided upon a lightweight motor cycle, is faced by another question, viz., whether to buy a four-stroke or a two-stroke. On this matter I cannot give definite advice without offending someone or other—and good riders, to boot—therefore, I will not give it, but will content myself by laying before my readers (if any) a few of the points which should be taken into consideration before a choice is made, recognising all the while that it will be in the end a case of *chacun à son gout*, which, being translated, means that any motor cycle will cure a chappie of his gout.

Simplicity.

If simplicity be desired, a two-stroke engine has the advantage, in the smaller number of moving parts. These consist of piston, connecting rod, gudgeon pin, crank, and axle carrying a flywheel, and a pulley or sprocket. The four-stroke has all these, and, in addition, inlet and exhaust valves with springs, tappets, and timing gear. But simplicity does not consist only in a limitation of the number of parts; extra parts are no real disadvantage, provided that they function as they ought to do, and give no trouble. It is true that valves must be ground in, and tappets adjusted at intervals, of which more anon. Returning now to the question of simplicity, it must be admitted that the four-stroke, having had to give pride of place to the two-stroke in the matter of the number of its moving parts, scores when the two pistons are examined side by side. In simplicity of action, too, I would give a four-stroke pride of place. The charge is, in four strokes of the piston (1) induced, *i.e.*, drawn into the cylinder, (2), compressed, (3) fired, (4) driven out into the silencer, or, in other words, exhausted. In the rival engine two of these processes are sometimes being performed at the same moment. While the piston is rising in the cylinder, a charge already in place is being compressed into the cylinder head and another charge is being drawn into the crank case. The first mentioned charge is then fired, and while it expands the second is partially compressed. As the piston approaches the bottom of its stroke, first the exhaust and then the transfer ports are opened (unfortunately, they close in the reverse order), and while the burnt gas escapes, the charge, which has been partially compressed in the crank case, is transferred to the cylinder, and helps to drive the exploded gas out through the exhaust port. This is effected by means of the deflector on the piston head, which turns the fresh gas upwards into the top of the cylinder, whence it descends, driving the burnt gases before it. The gases probably get mixed to a certain extent, and doubtless some of the fresh gas escapes through the exhaust port, which, as has been already stated, is still partly open after the transfer port has closed. As the piston of a two-stroke has to perform the duty of opening and closing the inlet, transfer, and exhaust ports, it must be a good fit in the cylinder, and the crank case must be compression tight.

Notes for the Novice.—

When of good quality, both two-stroke and four-stroke do their work extremely well. The former is well known for the excellence of its pulling uphill at moderate speeds, but as a rule it is not so fast as its four-stroke brother. As the mixture is first supplied to the crank case, a very simple method of oiling can be used, which consists of mixing half a pint of oil with a gallon of petrol. This is known as the petroil system. Against this must be set the fact that errors in oiling may upset the carburation, and, moreover, the petroil system is messy. Errors in carburation may cause a two-stroke to four-stroke, that is, to fire and misfire alternately, and consequently lose one of its chief advantages, which consists in its evenness of torque. In much the same way defective carburation will cause a four-stroke engine to eight-stroke.



The reciprocating parts of a two-stroke engine.

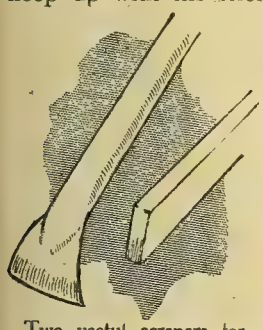
Transmission.

Another much debated point is the question of transmission. Personally, I am, and have been for years, a chain enthusiast; therefore lovers of the belt can skip this part or condemn it right away as the lucubrations of a bigoted idiot. I will, however, go so far as to admit that if there is one class of motor cycle on which a belt should be successful it is the class about which I am now writing, *i.e.*, the lightweight. On one point a belt certainly scores; it is more easily mended than a chain, and this can sometimes be done without soiling the hands much. This is lucky. On my own machines I have broken one chain in ten years; once when riding a borrowed machine I mended a belt five times in a fortnight.

A chain should be adjusted so that it is not tight in any position of the wheel, and it should be lubricated with graphite if exposed. Oil-tight cases are, of course, desirable, if well made and carefully fitted, but a tight guard does much to keep a chain in good order, as it keeps water from dripping off the mudguard on to the chain when the machine is standing.

Concert Pitch.

Now the owner of a lightweight constantly tries to keep up with his friends who are mounted on more powerful machines—and he does it too—but this, alas, means that his machine is more often driven near the limit of its speed and power than theirs, and consequently it needs more frequent attention.



Two useful scrapers for removing carbon deposit.

It is a common complaint against lightweights that they are more difficult to keep in tune than their more powerful brethren. This is hardly a fair statement; there may be something in it, but it requires some amplification. The real facts are as follows: (1) It is more difficult to keep any machine up to the extreme limit of its tune than to keep it in moderate order only; (2) a machine needs more attention when it is commonly run all out with an open throttle than when—to borrow a phrase from a friend—it is generally allowed to amble along on quarter throttle. Thus we see that a lightweight is likely to need more attention than a heavyweight, not because of any inherent defect in itself, but because of the treatment it often receives. The exceptions to this statement, as a general rule, are when lightness is carried to excess and certain parts are not up to their work, but such mistakes in design are not restricted to lightweights; there are numerous examples to be found even in the heaviest sidecar outfits. Of this the A.C.U. Six Days Trials will be witness, and the fact that, the combustion head of a little engine being smaller, a certain amount of carbon deposit, say $\frac{1}{16}$in. thick, will reduce the space by a greater percentage than a similar thickness of carbon will reduce the combustion chamber of a larger engine.

Valve Grinding and Piston Rings.

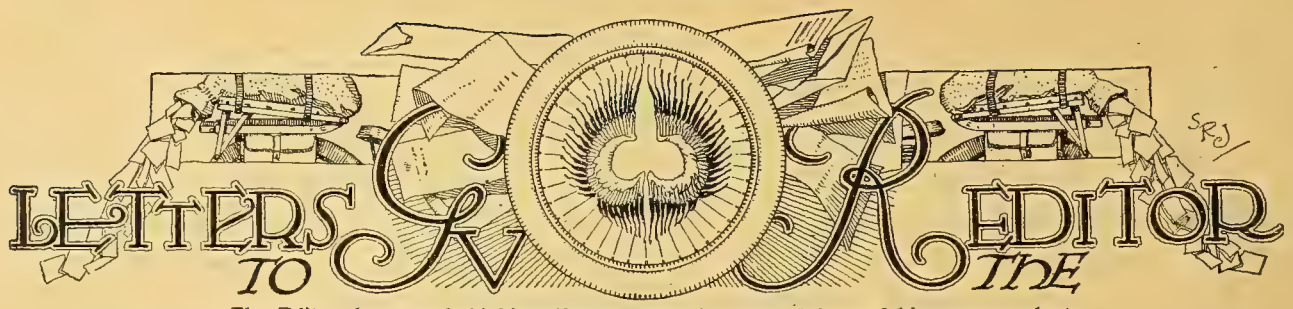
It is not advisable to do more grinding than can be helped in the engine, as this wears away the valve seating and forms pockets, which very seriously restrict the flow of the gas past the valves. Various ingenious devices have been sold to assist the operation of valve grinding, and it is not difficult to fake something for oneself; for instance, a piece of wood 2in. thick may have a hole bored through it to fit the valve stem, care being taken that the hole is bored at right angles to the surface. This hole should then be enlarged to the depth of about a quarter of an inch, and equal in diameter to the inside of the valve seating; the edge of this hole should be bevelled neatly with a knife and smoothed off with sandpaper. It may also be necessary to enlarge the top of the centre hole a trifle to admit the valve stem, which often increases a little in diameter where it joins the head. If a brace and suitable bits are available the operation is much simplified, in which case it is better to begin by boring the larger hole. When a valve requires grinding, the process can be commenced by placing it in this block with a piece of emery paper, through which a hole has been cut, underneath it. The block can then be held in a vice and the valve turned with a brace and screwdriver bit (a simple screwdriver will do if a brace is not forthcoming). Most of the pitting can be removed in this manner if care be exercised, and the valve finished by grinding in the cylinder in the usual manner with fine grinding paste or powder mixed with oil.

Examples of two-stroke and four-stroke pistons. In this case the palm for simplicity lies with the four-stroke.

Provided that the piston rings are free in their grooves and oily, it is not necessary as a rule to remove them, as a little dirt behind them does no harm; in fact, many think it an advantage.

When decarbonising, the rider of a two-stroke should always remember to scrape the ports thoroughly. This applies particularly to the exhaust port. If the piston be removed for any purpose, care should be taken to replace it correctly, *i.e.*, with the sharply curved side towards the transfer port and the gradual slope towards the exhaust.

J.H.W.



The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

NOMENCLATURE.

Sir,—May I suggest one of the following for the sidecar taxi: (1) Sidescab; (2) Sideshar; (3) Sidetaxi?

W. M. TOMLIN.

LUBRICATION OF NAKED CHAINS.

Sir,—I have found the following simple plan very satisfactory: Put a lump of the ordinary thick tallow and graphite chain lubricant in a flat tin, thin down with petrol to the consistency of thin oil, and apply with an old tooth brush.

H.B.

Greenwich.

DOUBLE-ACTING STEAM ENGINES.

Sir,—With reference to Mr. R. C. Stebbings's letter on "Torque and Comfort," he mentions that high speed steam engines are generally, with one notable exception, single-acting.

I wish to inform him that Messrs. W. Lisson and Co., Ltd., of Gloucester, are world-famed for their high-speed double-acting steam engines.

I should like to know which firm he refers to that makes the notable exception.

H.A.T.

Gloucester.

SIDECAR ADJUSTMENT.

Sir,—Can any of your readers state definitely the best method of adjusting a sidecar, as the makers' opinions differ greatly?

Two very well-known companies say that sidecar and cycle wheels should be parallel and vertical; another company says that wheels should be ¾in. out of parallel (narrow in front), but vertical; and a third concern says wheels should be ½in. narrower in front, sidecar wheel vertical, and cycle wheel leaning slightly outwards.

The position of the sidecar axle relative to the bicycle axle also differs greatly in various makes.

The points in question are:

(1.) What is the best position for sidecar wheel, *i.e.*, level, before, or behind cycle wheel?

(2.) Should cycle wheel be vertical or leaning outwards?

(3.) Should cycle and sidecar wheels be parallel or narrower in front?

(4.) Assuming other adjustments be correct, must sidecar wheel be vertical, *i.e.*, does it matter if wheel tilts slightly outwards owing to an oversize tyre being used on the cycle?

W. R. SMITH.

OWNER GOING ABROAD.

Sir,—In reply to your correspondent writing under the above heading, I would like to inform him that there are difficulties in taking cars and motor cycles abroad, and it is also likely to prove an expensive item to those not initiated in the formalities of packing machines, arranging delivery to the docks, freightage, and insurance, etc. I would strongly recommend anyone wishing to take his machine with him to get in touch with one of the many firms of shipping agents, who would undertake the delivery of the machine to any port required, on payment of a stated sum agreed beforehand.

There are many owners who believe the wisest course to be to dispose of their machines before leaving for abroad in the hope of being able to purchase their requirements the other side, but, as your correspondent states, there are very great difficulties in purchasing British motor cycles abroad. I do not think that British manufacturers, generally, have given sufficient support to the question of British motor cycles and cars abroad, mainly due, I believe, to the want of a clearly defined policy. In your correspondent's case he sent to an English firm to purchase an outfit to be sent to him in India, and the firm were unable to supply, owing to the makers' restrictions. The explanation is, I think, that the foreign agencies are allotted to various merchant houses, and orders may, therefore, only go through those particular merchants.

I should be very pleased to help your correspondent or anyone else who may have the same difficulties, and I will endeavour to give them assistance to enable them to obtain their requirements.

L. W. TAYLOR.

A POST-1921 IDEAL.

Sir,—I have always had a soft side for twin two-strokes, and share your surprise that, "despite the fact that it has held its unique position for several years, the Scott remains the only twin two-stroke on the market." My ideal mount would be a cross between the Sunbeam and the Scott, that is to say a twin two-stroke (but air-cooled if feasible) with chain-drive enclosed in an oil-bath gear case, with the orthodox type of frame, and everything protected from mud, etc., as in the Sunbeam. It wasn't at Olympia.

I think such a machine would be very popular and should like to see other readers' opinions on the matter, and on points like the following: Is an air-cooled twin two-stroke practicable? What relative position of the cylinders would give maximum cooling? What drawbacks would such an engine have? I think its advantages are obvious.

I hope no one will imagine that I am finding fault with either the Scott or Sunbeam machines. They are already known by their successes.

SIGMA.

Macduff, N.B.

CHAIN DRIVE ON SPRING FRAME MACHINES.

Sir,—Some time ago you were kind enough to publish a letter from me on the question of the design of spring frames for motor cycles, and especially their relationship to the satisfactory arrangement of a chain drive on such a machine.

Since then I have followed with interest your various correspondents' suggestions and descriptions, and am now venturing to write to you again, as I have, within the last few days, come across a chain drive spring frame motor cycle of rather novel design, which has overcome the great objection of variable chain tension of the rear drive in a very simple manner.

The machine is known as the "Ayres-Leyland," and is, in arrangement, very similar to the majority of spring frame designs, inasmuch as the chain stays are pivoted at the bottom of the seat-pillar tube, the spring motion being controlled by a cantilever spring carried just below the saddle as in the ordinary arrangement. The gear box, however, instead of being secured between the pivot and the engine, is actually secured to the chain stays, and consequently the final drive works at fixed centres irrespective of any movement of the back wheel. Certainly, there is a slight variation in the centres of the engine to gear box drive, but this, owing to the small movement of the gear box, only amounts to a few thousandths and is negligible. On a test run the behaviour of the machine, both as regards its springing and the running of the chains, was most satisfactory, and it appears to me as though at least one designer has secured that ideal of all designs, efficiency with simplicity.

T.

Hale, Cheshire.

A FAIRLY TALL ORDER.

Sir,—Can anyone tell me where to find a lightweight two-stroke, which can be used without any exertion, on which a fair sized man does not appear ridiculous (26 or 28in. wheels); which can be ridden in all weathers in ordinary clothes without mess from mud or oil; which can be used any time of the day or night, at a moment's notice (electric lighting); which will oil itself and not by any chance flood with oil; which will climb any hill; and which will give a year's silent service of daily pottering in a hilly district on present-day roads without attention to engine and transmission, frame, or tyres—save replenishment with fuel and oil weekly? G.P.

Sheffield.

A READER'S RUNABOUT.

Sir,—I am enclosing a photograph of a three-wheeler on purely motor cycle lines, which I have made; the chassis design is registered.

The machine is of simple construction, the frame being all straight standard tubes and lugs.

I have driven this machine 3,000 miles since Whitsuntide without any overhaul and with no trouble, except for a small one in the clutch. The consumption is just short of sixty miles per gallon.

A home-constructed three-wheeler, entirely on motor cycle lines, referred to in the letter of Mr. H. D. Day.

The following is a short specification of the machine, which is not so short and tubby as appears in the photograph:

ENGINE.—5-7 h.p. Coventry Victor, air-cooled.
GEAR.—Sturmey-Archer.
TRANSMISSION.—All-chain.
STEERING.—Rack and pinion.
SPRINGING.—Semi-elliptic in front and tension springs in rear.

I have climbed all hills I have met in my journeys, including Midland test hills. H. D. DAY.

THE LAST NIGHT OF THE SHOW.

Sir,—With reference to the Motor Cycle Exhibition which has just been held at Olympia, I should be glad if you could find space in your valuable paper and put on record the protest of many exhibitors as to the infernal pandemonium created by various irresponsible assistants towards the end of the Show.

It is surely known that this sort of thing is distinctly forbidden in the agreement of the exhibitors, and I think that the Society should see that this rule is not flouted.

This year the blowing of horns started soon after 8 p.m., when there were still visitors trying to get information with a view to purchasing; and personally I can say one such visitor left our stand and quitted the building disgusted. Certainly he said he would call at our works; but will he? Further, I think it is disgusting and insulting to the orchestra, who were doing their utmost to render good music.

I think it a duty to write this, as I have attended every Show from 1899 onwards in this country; and I think we can take it that the exhibitors are there for business, and not obnoxious foolery. Certainly, as every Exhibition ends, the matter gets worse and starts earlier.

I am not a kill-joy, and if the last hour finishes up in a social and dance it would be pleasant, but I should be very sorry to see our splendid Exhibition drop down to the level of a "penny gaff" or Mitcham Fair.

JOHN J. LEONARD,
THE BAT MOTOR MANUFACTURING CO.

THOSE INCREASED SUBSCRIPTIONS.

Sir,—There is no difficulty in answering the question asked by "Bled Dry." The pre-war subscription paid by A.A. motor cycling members was 10s. 6d. per annum; this subscription brought them all the benefits enjoyed by motor car members paying £2 2s. per annum.

Everything has gone up in cost, and the pre-war subscription is to-day quite inadequate for covering the expenses incurred in rendering the services afforded to our motor cycling members. There is no profiteering in this development—it simply resolves itself into a matter of necessity.

STENSON COOKE,
Secretary, Automobile Association and Motor Union.

Sir,—Permit me to tell "Bled Dry" what the A.A. has done for me during the last year's membership.

In April I was caught riding without lights. With one day's warning the Association found and sent a solicitor to defend me.

In August, I took my outfit to Belgium and France. I explained what I intended to do, and back came a sheet stating all the charges which would be incurred, *re* Customs, etc. On payment, I was in possession of all necessary papers and arrangements, and knew that whatever official tackled me, I had what he wanted—a great comfort!

Returned, a summons to appear at Kirkham, some sixty miles away, awaited me. I did not worry. The A.A. sent a man. All this by correspondence and telegrams, which made me feel that the organisation found it a pleasure to be able to help me.

In September, I broke my frame and back spindle at midnight sixteen miles from home, which cost me 10s. to have the outfit towed into Harrogate. I am perfectly certain that, had I had the impudence to present the bill to the Association, it would have paid it, but I did not.

Does "Bled Dry" feel "over" or "under-average" when an A.A. or A.C.U. sentry—paid out of the subscriptions of the "average" man—warns him of danger, or gives him the "all clear" at, say, cross roads?

It beats me to know why the subscription is still so small!

E. R. HINDLE.

Sir,—With reference to the letter of "Bled Dry," in your issue of December 2nd, surely the increased subscriptions of the A.C.U. and A.A. are justified if one considers the general increase of wages which their patrols, etc., must need in order to meet the present cost of living.

The advantages these organisations offer—the large body of patrols, free legal defence, touring facilities, etc.—are well worth the increased subscriptions now called for.

E. J. NOEL.

Sir,—Might I be permitted to occupy your valuable space with a reply to "Bled Dry's" letter?

Does he realise, in asking for a justification as to why the A.A. has increased its subscription, the increased cost of the work done by the A.A.? In fact, the cost in some branches must have been more than double long before now, and yet the subscription has not been altered at all!

As to what the A.A. does, may I let him have my own personal experience? A short time ago I had the misfortune to be summoned some distance from my home. My case was taken up by the A.A., defended by its solicitors (whose fees, like other things, have been raised), and all expenses paid by it.

Now, if I had *not* been a member I should have had the bother of going all that distance (120 miles), to say nothing of the expense and time taken, the cost of which would have been more than double my subscription. My case is one of many which the A.A. takes up, very often far more expensive to it than mine was, yet it does it for the same annual subscription. This instance is only one of many of the benefits I have gained, to say nothing of the benefits the motoring public receive in general.

A GRATEFUL MEMBER OF THE A.A.

Haywards Heath.

CARRIER DESIGN.

Sir,—The observer of the various whims of motor trade designers is struck by the peculiar stagnation of carrier design on motor cycles. The chief reason apparent for the present universal carrier is a desire to square off the end of the machine and to carry the number plate.

Unfortunately this square end of the machine is mistaken for a luggage carrier and used as such, the luggage in most cases being a human being. The manufacturer shrugs his shoulders, and declines to take any responsibility.

But now we have a leading saddle manufacturer fixing his springs to this inadequate square end, which has to carry the rider's weight and very often another rider as pillion.

It is now up to the manufacturer to build his carriers suitable for carrying two people, or to warn his customers that his carriers are not strong enough for the practice.

G. A. DOWNE.

DYNAMO LIGHTING ON A MORGAN.

Sir,—As a constant reader of your excellent paper, I noticed a few weeks back some photographs of Morgans fitted with dynamo lighting.

I have fitted my Aero model with a P. and H. dynamo lighting set, fitting the dynamo on a small platform on the front axle and taking the drive from the flywheel. It has proved extremely satisfactory, and on several occasions I have driven the machine all night, having full lights on for seven or eight hours, with no trouble whatever. I enclose a photograph of the machine showing lighting set, as I thought some of your readers might be thinking of fitting electric lighting, and the arrangement I have on my Morgan might prove useful.

How a dynamo lighting set may be neatly fitted to a Morgan is described in the letter of Mr. J. Barker. The dynamo is mounted on the front axle.

J. BARKER.

TEN THOUSAND MILES BEFORE DECARBONISING.

Sir,—As you will doubtless remember, you published in the year 1914 a short account I sent you with regard to running costs of a 2¼ h.p. New Hudson two-stroke two-speed model.

As the present demand is even more for economy in running costs, I thought the following particulars would be of general interest to your large number of readers, being my experience with a Douglas 4 h.p. combination purchased last January in Birmingham, and since used daily and done over 10,000 miles in the extension of my business between Bristol and Penzance.

I am more than pleased to be able to state I have never had a mechanical stop during this period, and now, after ten months' continual use, the total cost of necessary repairs is under £2.

You will notice by the photographs the amount of carbon deposit on the piston head is not excessive. The condition of the valve stems, valve seatings, and the engine generally is excellent, having in view the fact that the machine has been out in all weathers and never taken down for cleaning until a few days ago.

When I first checked my petrol consumption I was doing 55 m.p.g., but in March last I altered the petrol level and changed the 28 jet for a 24, which brought my average consumption up to 65 m.p.g. for town work and 70 m.p.g. on long distance runs. Of course, I spent some little time before finally obtaining this improved mileage, but the setting of the carburetter now gives me uniform results, and I have always used one brand of motor spirit, namely, Carburine.

One can hardly recommend the practice of running 10,000 miles without decarbonising; but, except for a very slight loss of power in the last 1,000 miles, I found no other ill-effects, which speaks well for the lubricating system and Filtrate air-cooled oil, of which I have always used a plentiful amount, but feel that it was true economy having regard to the excellent running and the small repair bill.

I only wish that I had some interest in the Douglas firm other than being, as I am, a very satisfied private owner.

E. VICTOR ABEL.

[Regarding the photographs (which, unfortunately, would not reproduce with sufficient clearness), we fully bear out our correspondent's statements that the carbon deposit shown is very slight indeed considering the mileage.—ED.]

SPEED WOBBLE.

Sir,—As a constant reader of your interesting paper for the last five years, I should like to claim a little space to express my views regarding speed wobble.

I may say that I am an experienced rider, and have done a lot of motor cycle racing in this country, but I cannot understand why a number of your correspondents "spill" as soon as they get a bit of a wobble on. I have had wobbles at all speeds up to and over 80 m.p.h., but have never had any difficulty in overcoming them. Here in New Zealand all the racing is done on unbanked grass racecourses laid down for horse racing, and, although one or two of them are fairly smooth, the majority are so rough that the front wheels of the faster machines lift from anything from a foot to eighteen inches off the ground at the worst bumps. When they come to earth again "speed wobble" is generally the rule, but for all that I have never seen a rider spill from that cause.

That speeds of 60-70 m.p.h. are impossible off the track, as stated by your correspondents, appears to me to be utterly ridiculous. On the road I have done 65-70 m.p.h. with both Indian and Harley-Davidson, both in really good running order, but neither specially tuned; and I have turned up 78 m.p.h. (timed and speedometer) with a well-tuned four-cylinder Henderson, also on the road. This machine would do over 70 m.p.h. before it was tuned up. Contrary to what I have said in the last paragraph, I have never had a sign of a speed wobble on the road, and have seen a boy seventeen years of age riding an Indian over a smooth piece of road at over 60 m.p.h. with his hands in his pockets.

Perhaps some of your readers will be interested in the speeds that are put up in New Zealand on the unbanked grass courses. Some of them are: Flying mile, 49⅗s., equal to a speed of nearly 73 m.p.h.; fifteen miles (standing start), 13m., or an average speed of 69 m.p.h. These times were put up by P. Coleman on an eight-valve Indian on the Takapuna Racecourse at Auckland, which is the best in New Zealand for motor cycle racing. The mile record for singles is 57s., done by a four-valve 3½ h.p. Indian.

Cambridge, N.Z. N. R. SOUTER.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle*.

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"MOTOR CYCLE REMINISCENCES." By "IXION," of *The Motor Cycle*. An interesting and amusing description of early motor cycling experiences, with many unique illustrations ...	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

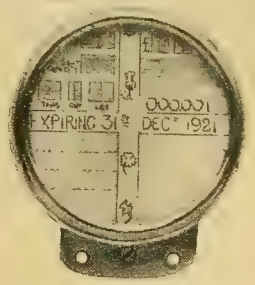
Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20 Tudor Street, London, E.C., or of leading Booksellers and Railway Bookstalls.

Holders for Next Year's Licence Cards.

Many Examples of an Accessory brought into being by the New Licensing System.

A neat aluminium holder for the sidecar body by the Taw Co.

Rotherham's holder, which is affixed to the handle-bar at its centre.



One of the neatest of the new holders, the Carlton, which sells at a low price.

A clean exterior characterises the Dunhill holder.

The Taw Co.'s brass holder, for the handle-bar.

IT is only to be expected that the accessory makers are now busily engaged in working out their ideas for carrying the new licence card which will be necessary on and after January 1st, 1921.

The first firm to submit their samples to us—and they deserve to be congratulated on their enterprise—was Messrs. A. W. Gamage, Ltd., Holborn, London, E.C.1, who sent two holders, one of which might be attached to the panel of the sidecar body, while the other could clip on to one of the front fork members or on to the handle-bar. These holders were well finished, and made strictly to Government specification.

Another idea has been carried out by the Brookes Manufacturing Co., Ltd., Stud Works, Aston, Birmingham. This consists of a licence holder made in one with the steel front number plate—an idea which is very ingeniously carried out. A similar device was also shown which is suitable for attachment to any other part of the machine.

The combined number plate and holder idea seems quite good, and the Atlas Engineering Co., of Hill Street, Coventry, who specialise in cast aluminium number plates, are embodying a holder cast with their front plates, which makes an exceedingly neat job. Other patterns by this firm, intended for handle-bar position and sidecar panels, are also offered in cast aluminium.

Messrs. R. Cadisch and Sons, Ltd., 171, Great Portland Street, London, W.1, produce two types of holders, one provided with a clip to fit on the handle-bars, and the other with a bracket attachment. These models have a very pleasing appearance, and, provided with a waterproof washer, fulfil the Government requirements.

The Service Co., Ltd., 289, High Holborn, London, W.C.2, market both a square and a round licence holder. The former is provided with a rubber washer and a metal back-plate. It is proposed to fit a clip attachment as well as bracket.

Combined holder and front number-plate produced by the Brookes Manufacturing Co., and an alternative pattern for fixing to existing number-plates.

The circular model is well finished, and will be fitted with similar clips to those of the square model.

Perhaps one of the neatest of the holders so far submitted to us is the Carlton, marketed by Spencer Bros., of Priory Street, Coventry. It has fewer nuts and bolts than the majority, and, having no flanges, is smaller in over-all diameter. Embodying a rubber packing ring, and having the back plate well inside the rim of the circular front, it is perfectly waterproof. Further, its price is lower than the majority, and is sold at 2s. 9d. with clips, or 2s. 6d. without, plus 6d. postage.

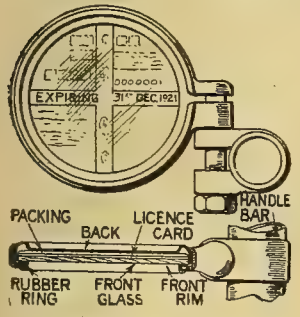
The lightest holder we have yet seen is the product of the Taw Manufacturing Co., Campsbourne Works, High Street, Hornsey, N.8. It is made of aluminium and weighs but 2 oz. and sells at 4s. A similar holder is also made in brass, and either may be obtained with a clip fitting for 5s.

Dunhills, of 359-361, Euston Road, N.W.1, have also produced a very cleanly designed holder, which uses only three small bolts to hold it together. It has a very smooth exterior, and the back plate is well recessed into the rounded flange. An alternative to the one illustrated has a handle-bar clip, and is sold at 8s.

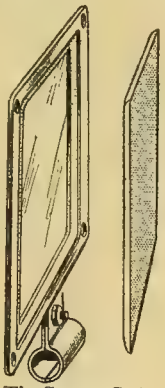
Another well-made licence holder is made by Rotherhams, of Coventry; while Stanley and Hill, Ltd., Birmingham, the makers of the well-known Motex lamps, are also producing holders for both motor cycles and sidecars, as are Tuck and Blakemore, Ltd., of Coventry.

F.R.S. Lamps is still another firm which has not been slow to take advantage of the compulsory demand for this new accessory. In this case the makers have reduced the total number of bolts to one. The price is 5s.

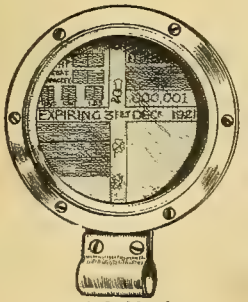
Among other firms marketing licence card holders may be mentioned Messrs. S. Smith and Sons, Ltd., 179, Great Portland Street, W.1.; A. J. Dew and Co., 21, Endell Street, W.C.2; the British Sheet Metal Co., Ltd., 24, Finsbury Square, E.C.2; Wright and Sons, Edgware, Middlesex; and W. Brandish and Sons, Foleshill Road, Coventry.



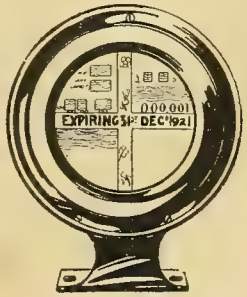
A holder with a "one nut" fixing offered by "F.R.S. Lamps." Below, a sectional plan view shows how it is constructed.



The Service Co.'s square holder



Gamage's holder for the handle-bar.



Cadisch's holder.

Cast with the aluminium front number-plate; a specialty of the Atlas Engineering Co.

CURRENT HAT

Times to Light Lamps.

,, 18th	... ...	4.20 ,,
,, 20th	... ...	4.21 ,,
,, 22nd	... ...	4.21 ,,

Next Year's Outputs.

From many quarters we hear that next year's outputs were sold at the recent Show.

More Daylight.

Although actually December 21st is the shortest day, evenings are already drawing out. Lighting-up time to-day is one minute *later* than yesterday.

The Sporting Solo Mount.

The sporting solo "mediumweight" is coming into its own. An article on the new machines of this type appears on page 808.

"It's an Ill Wind."

The only people who bless the new "carry your licence where it can be seen" regulation are the accessory makers. Some of them are very enthusiastic!

Electric Lighting Everywhere.

With more than half the machines at the Olympia Show equipped with electric lighting outfits, chiefly combined with the ignition systems, it is safe to predict that few of the London-Exeter competitors will trust to acetylene.

Imports and Exports for November.

The Board of Trade returns of foreign motor cycles and parts imported during November show a decided decrease both in numbers and value over the corresponding figures for October. The actual figures with comparative amounts for two previous years are:

IMPORTS.

	Nov., 1913.	Nov., 1919.	Nov., 1920.
No. of motor cycles ...	61	154	148
Value of machine and parts	£9,148	£14,051	£20,491

Compared with last month there is a fall in the number of British motor cycles exported during November; but it will be noted that the total figures are well over double those of the corresponding month last year. The B.O.T. figures are as follows:

BRITISH EXPORTS.

	Nov., 1913.	Nov., 1919.	Nov., 1920.
No. of motor cycle	1,427	838	1,869
Value of motor cycle only	£64,373	£60,868	£156,405
Value of part and accessorie	£10,990	£30,757	£83,284
Total value ...	£83,363	£91,625	£249,689

Hints for the London-Exeter.

As the entry for the M.C.C. London-Exeter-London run on December 27th and 28th is a very large one, it is more than ever necessary to ensure that the event is carried out without giving offence to the general public. Riders should endeavour to make sure that their machines are efficiently silenced, since a long string of competitors in the middle of the night is apt to give annoyance to residents along the route. The captain of the M.C.C. (Mr. W. H. Wells) points out that overalls and wet motor clothing must be removed before entering the official hotels.

Buy Now.

From now till about the end of February there will be an unexampled opportunity of buying second-hand machines at extremely low figures. Several factors contribute to this state of affairs. The usual slackness at this time of the year, of course, is partly responsible, but even more so is the new taxation scheme. It cannot be too strongly emphasised that it is to the advantage both of the buyer and of the seller to carry through such transactions now, and thus to avoid the necessity of paying a greatly increased tax twice over. Later on, next year, owners who have paid the tax on mounts they then desire to sell will be compelled to increase their prices by corresponding figures.

Special Features.

THE SPORTING SOLO MOUNT.

CAR PRACTICE AND MOTOR CYCLE DESIGN.

THE IDEAL MINIATURE.

Licence Card Holders.

Elsewhere in this issue will be found particulars and illustrations of many of the new licence card holders.

A Month's Grace.

The new tax on motor cycles used any time during January next must be paid before the 31st of that month.

To be a Solo Trial.

Arrangements for the proposed motor cycle fox hunt in the Cudham district are in the hands of Mr. T. J. Ross, captain of the Woolwich Club, 6, High Road, Lee, S.E. He states it will be a solo trial.

Where are the Progressive Cities?

An enormous potential demand for sidecar taxicabs was revealed at the Show, but the business cannot be developed pending the issue of hackney carriage licences. Surely some go-ahead city will rise to the occasion and give a lead. An article dealing exhaustively with all phases of the subject will appear in our pages in the near future.

A FAMILY OF PRACTICAL RIDERS. The producer of Ivy motor cycles, Mr. S. A. Newman (second from left), with his four sons. Howard C. (third from left) is the designer of the Martinsyde-Newman engine, while Percy (fourth from left is responsible for the 3 h.p. Ivy two-stroke. All are mounted on Ivy machines.

Cars at the Brussels Show.

To-morrow's issue of *The Autocar* contains a fully illustrated description of the new car exhibits at the Brussels Show.

English as a Medium.

At the Brussels Salon last week it was amusing to listen to a certain conversation in English between a Belgian, who knew no Dutch, who was explaining the advantages and points of the A.J.S. to a Dutchman who had no French.

Midland Centre A.C.U.

The Midland Centre A.C.U. will organise the 1921 open events for which permits have been granted to the Birmingham and district clubs. This was decided at the meeting of club delegates which was held at Wolverhampton last Saturday. The decision means that individual clubs or groups of clubs will no longer run their big events in their own name, but that a trials committee, consisting of the secretary and trials secretary of each of the affiliated clubs, will jointly organise the open events in the name of the centre. At a previous meeting it had been decided to divide the Midland area into sections according to the number of permits granted to the centre, and that the clubs in the different sections would co-operate in organising the trials. If the whole of England eventually comes under the centre system and these local branches follow the lead given by the Midland Centre, then all open trials in the future will be A.C.U. events, and will be automatically distinct from the club trial.

The M.C.C. Annual Dinner.

On Friday last, December 10th, the Motor Cycling Club held its fourteenth annual dinner at the Wharncliffe Rooms, Hotel Great Central, London.

In the absence of the chairman, Lt.-Col. Charles Jarrott, O.B.E., Mr. R. Head took the chair. A large number of members and guests were present, and, at the conclusion of an excellent dinner, the chairman distributed a number of awards which had been gained by members of the club during the year.

The recipients of the primary awards of the London to Land's End Run were as follows: The Jarrott Cup, T. S. Sharratt; the Pettyt Cup (for sidecar machines), W. H. Elce; the Lester Cup (for light cars), W. B. Gibb.

The winners of the cups awarded for the events run off at Brooklands were: The Harry Smith Cup, Kaye Don; the Wells Cup, J. A. Masters; the Seed Cup, R. C. Empson; the Albert Brown Cup, B. S. Marshall; the O. C. Godfrey Cup, S. E. Garrett.

The Motor Cycle Cup, awarded to the winning team in the Inter-club Team Trial, was handed to representatives of the Leicester and District M.C.C.

No speeches were made. The Chairman, however, when expressing his appreciation, was glad to announce that the membership of the club now exceeded 1,000, and that a record entry of 230 had been received for the London-Exeter Run on Boxing Day.

A most entertaining musical programme followed, but it is doubtful whether the "no speeches" experiment will be repeated, as the evening did not seem complete without them.

Sidecar Taxi for Birmingham.

A hackney carriage licence was issued in Birmingham last week for a taxi-sidecar, which is now plying for hire on the streets of that city.

Wintry Weather.

Last week-end saw the whole country frost and snow bound. Nevertheless, many hardy riders were seen on the roads and one or two club runs were held.

Motor Sleighing.

The query has recently been raised as to the advantage that is claimed for the American idea of substituting skids or runners for the front or sidecar wheels for snow riding. A cynic of our acquaintance remarks that he has found rubber tyres possess remarkable skidding propensities.

The New Enfield Engine.

There seems to be some misapprehension regarding the engine fitted to the 1921 8 h.p. Enfield outfit. The fact that it is made by Messrs. Vickers caused it to be confused with proprietary engines available to the trade generally. The unit is essentially of Enfield design, and is made exclusively for the Enfield Co.

Licence Card Holders.

Following upon our outline of the new licensing regulations, published in *The Motor Cycle* of November 25th, last week's issue contained (page 764) full details with suggestions of how and where to fit the new licence card in order to comply with legal requirements. This week we are able to describe a batch of holders specially designed for use on motor cycles. Motor cyclists should realise that penalties may be inflicted for any breach of the regulations, and, in order to prevent misunderstandings, we shall be glad to answer any questions with regard to points in the new taxation not clear to readers, through out queries department.

Monday's Lucky Postbag.

For four weeks Maudes' Motor Mart are offering a new Autoped scooter as a prize to a customer whose order is opened first each Monday morning. Even the purchaser of a 1s. 9d. plug is eligible.

The F.I.C.M.

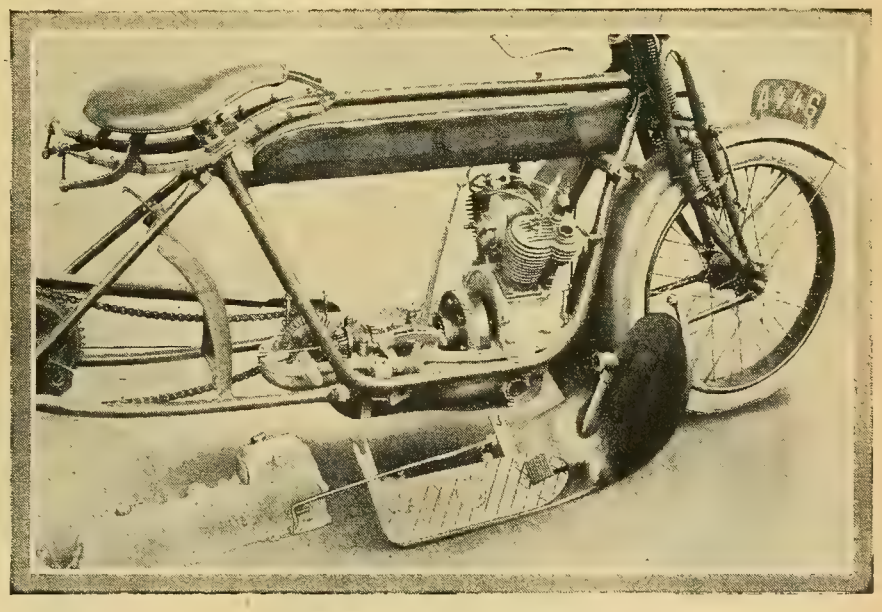
The next meeting of the Federation of International Motor Cycle Clubs will be held at the Belgian Royal Automobile Club on Monday, January 20th. The business to be discussed will be important and interesting, since it will largely deal with the question of rules governing international records. These rules, when passed and confirmed at the meeting, will come into force as from January 1st.

The Necessity for Insurance.

We are afraid we cannot agree with that optimist who smilingly declares that he will pay the £4 taxation on his sidecar outfit instead of insuring his machine next year. Admittedly motor thefts will be very difficult under the new registration scheme, but only time may prove that they are impossible, and, anyhow, insurance covers more contingencies than theft.

A Corsican Grand Prix.

We understand that the Automobile Club of Nice is organising a motor cycle race in Corsica on April 2nd to 6th next. Corsica is a delightful island possessing fairly good roads of the mountain variety, with numerous corners, and fairly steep gradients, so it may be anticipated that an accentuated T.T. course will be chosen. The race will be for two classes of machines, those of under 350 c.c. and from 351 c.c. to 500 c.c. The competition will be run under international rules and the rules of the Union Motocycliste de France. Entries cost 400 fr. per machine, and will close at ordinary fees on February 25th. Numerous prizes will be offered. On Wednesday, April 6th, there gold medals.

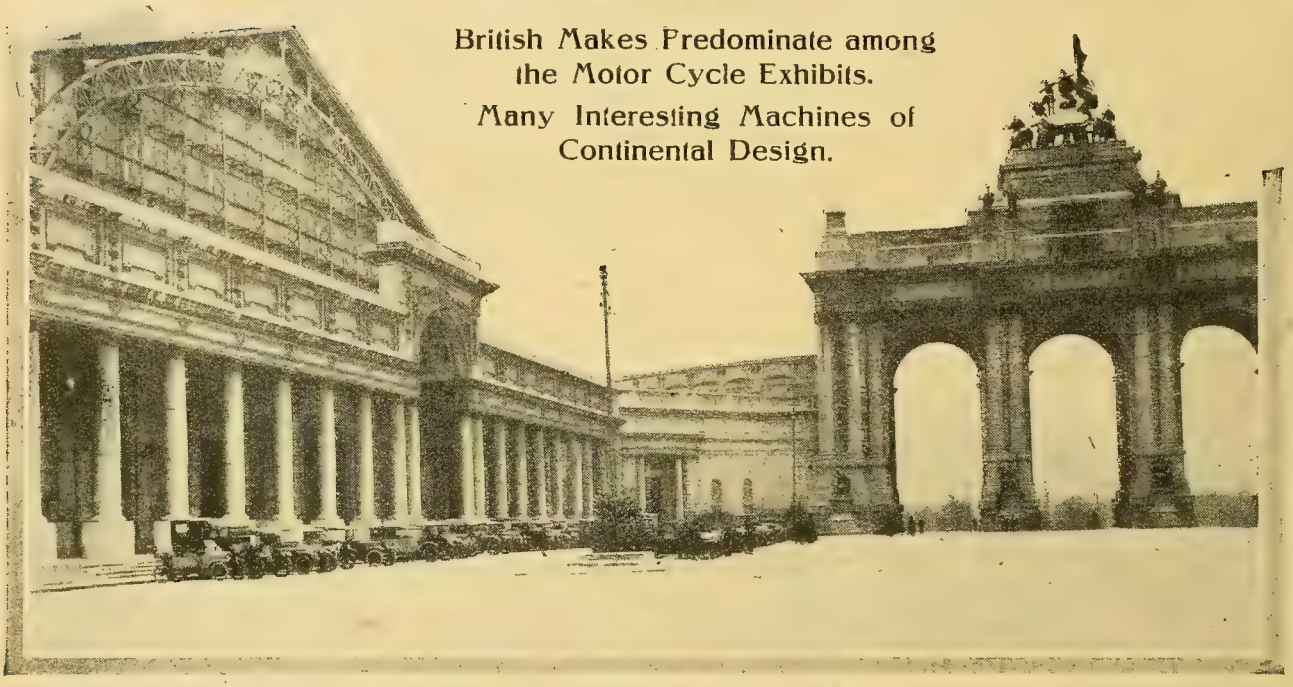


AT THE BRUSSELS SHOW.
Gear-box cover removed from the unconventional S. Spring; observe the toothed ring used to circulate the lubricating oil.

THE BRUSSELS SHOW.

British Makes Predominate among the Motor Cycle Exhibits.

Many Interesting Machines of Continental Design.

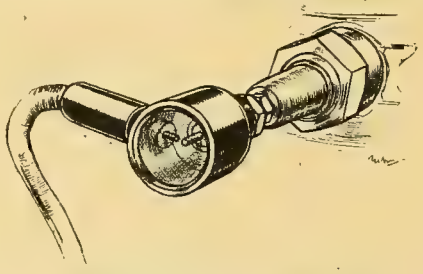


NO fewer than twenty-four makes of British motor cycles are exhibited at the Brussels Show, which opened on Friday last. This number is more than all the representatives of other countries put together. Of the balance, three are Belgian, seven French, seven American, and one Swiss, making a total of forty-two. In addition, many British makes of sidecars are exhibited, like the motor cycles, by the Continental agents of the firms concerned.

The Brussels Automobile Show is held in a handsome building known as the Palais Cinquantenaire, which stands high up in the city, and is approached by a wide street. During the German occupation it was used as a motor vehicle repair depot, and the damage done has only recently been repaired.

Pioneers.

Belgium has been associated with the motor cycle from the earliest period in its history, and motor cyclists owe this brave little country a great deal, as its early productions had a very distinct effect upon design generally, and helped to accelerate the evolution of the modern British mount. It must not be forgotten that the first motor cycle engine produced in quantities, and equipped with mechanically-operated inlet valves, was the Minerva, hailing from Antwerp, which appeared in England in 1902.



A novelty on the D.F.R. two-stroke—a visible spark gap.

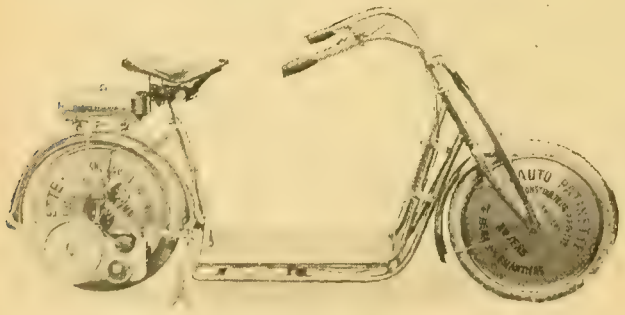
At the present time there are two distinct schools of thought among Belgian motor cycle manufacturers. There are those who have slavishly followed English ideas and those who struck out on original lines.

One of these latter is the Société Anonyme Ateliers Spring Streupaz-lez-Liège. Reference was made in *The Motor Cycle* to this interesting and original mount some eighteen months ago, since which date it has been modified slightly

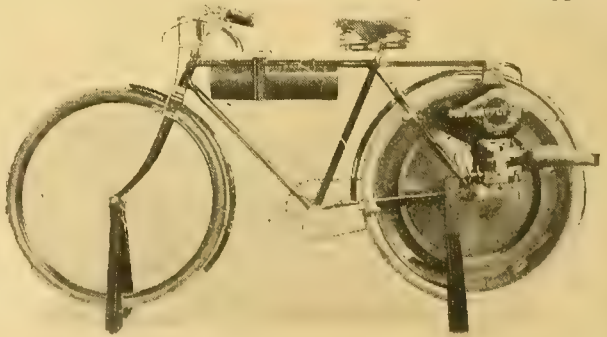
The Spring Motor Cycle.

The Spring is made in two twin-cylinder models—the 3½-4 h.p., 65×75 mm. (500 c.c.), and the 6 h.p., 72×92 mm. (750 c.c.). Perhaps the chief feature of the design is the position of the V twin engine, placed transversely in the front end of the duplex frame. The cylinders are set at 50°, and have side-by-side valves facing forwards. Inlet and exhaust pipes in each cylinder are held in place by a single central bolt and bridge piece, a simple and effective method, which makes for security and yet is easily dismountable.

The lubrication system is by splash, but is ingeniously arranged. Since the crank and gear box are in a single unit, the flywheel has its own compartment, at the base of which there is oil up to a certain level. To facilitate the distribution of the lubricant, the flywheel is supplied



An Auto-wheel is the propellant of this Auto-patinette



Motor-fly attachment with its cylinder below the crank case.

The Brussels Show.—

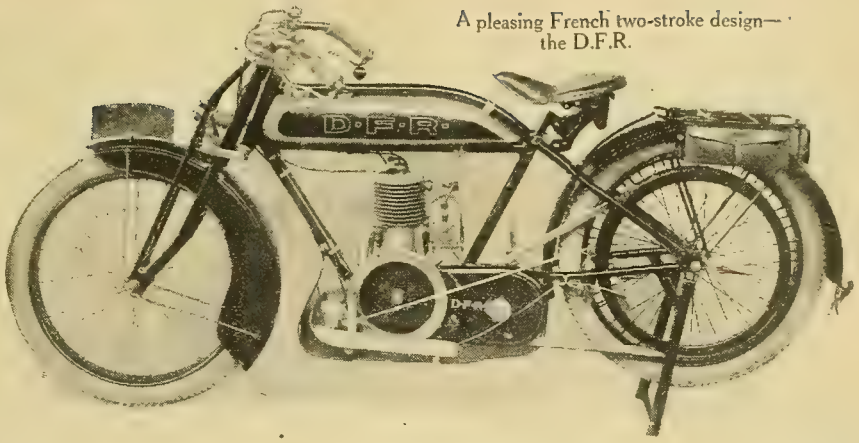
with a toothed ring similar to that fitted to cars when an electric starter is fitted. By this means the oil is flung into troughs which, sloping forward, feed it into a space beneath the crank into which the connecting rods dip. A neat oil gauge is provided, and is placed conspicuously on the crank case. In the 750 c.c. model there is an ingenious spring coupling between the flywheel and gearshaft, all shocks to the chain and transmission being absorbed by the laminated springs against which the coupling dogs abut. Behind the flywheel is the three-speed gear box of the ordinary sliding gear variety, while the final drive is by bevel and chain to the rear wheel. There is a further bevel at the end of the gearshaft, with which the kick-starter quadrant engages. On one model a spring frame is shown, of which the rear forks and chain stays are hinged to the top and bottom of the duplex saddle tube. The joint to the top is through a link, the upper end of which is attached to a bracket under the saddle connected to an attachment on the top tube by a pair of coil springs, while a corresponding pair of springs are fixed from the same point to a fork arrangement at the rear of the saddle. The system is so arranged that the springing of the saddle and of the frame are interconnected, and the saddle is capable of movement without altering its distance from the ground.

Detail Fittings.

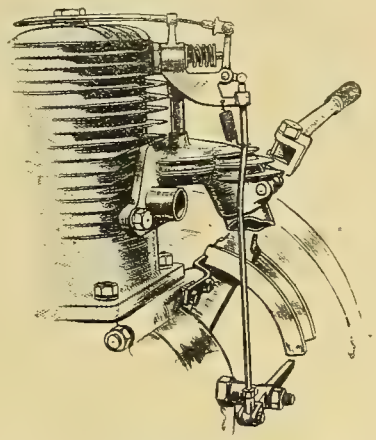
Being provided with knock-out spindles, both wheels are easily detachable. Both the front mudguard extension and the rear half of the back guard are detachable, so that either tyre is readily accessible, while with the rear guard are combined a spacious tool box and luggage carrier, and in the case of the 750 c.c. machine the rear stand is of channel steel. Each footboard is provided with a mudshield, in which is a slit set at such an angle as to deflect the air on to the adjacent cylinder, while under each is a separate silencer provided with a separate foot-operated cut-out.

F.N. Exhibits.

The other Belgian made motor cycle which struck out on original lines kept and improved upon them year by year is our old friend the F.N. The examples shown in the Salon are the same as those which were on view in Olympia. The four-cylinder model is equipped with an F.N. sidecar of handsome design, with the sidecar wheel enclosed by vertical and horizontal forks. The wheel spindle is mounted on tubes telescoping into the vertical forks, and abutting against enclosed coil springs. A luggage carrier was also fitted.



A pleasing French two-stroke design—the D.F.R.



The kick-starter and decompressor of the Gillet are interconnected.

A French Two-stroke.

Among the two-strokes may be mentioned the D.F.R., a French machine made at Neuilly-sur-Seine, and shown by MM. Berry Frères, 72, Boulevard d'Avroy, Liège. The engine is the well-finished Train 76×76 mm. two-stroke. In general design it follows British practice, having chain-cum-belt drive, Burman two-speed gear box, Saxon forks (made under licence) and petroil lubrication. One interesting feature was the visible spark gap embodied in the high-tension terminal.

The machine is shown in two forms, as a sporting and as a touring mount, and in the latter form it has an excellent undershield which protects the chain and other working parts. The Train water-cooled two-stroke engine and an air-cooled twin-cylinder of 6 h.p. were also shown by this firm. The latter follows standard lines, but is chiefly conspicuous for its excellent finish.

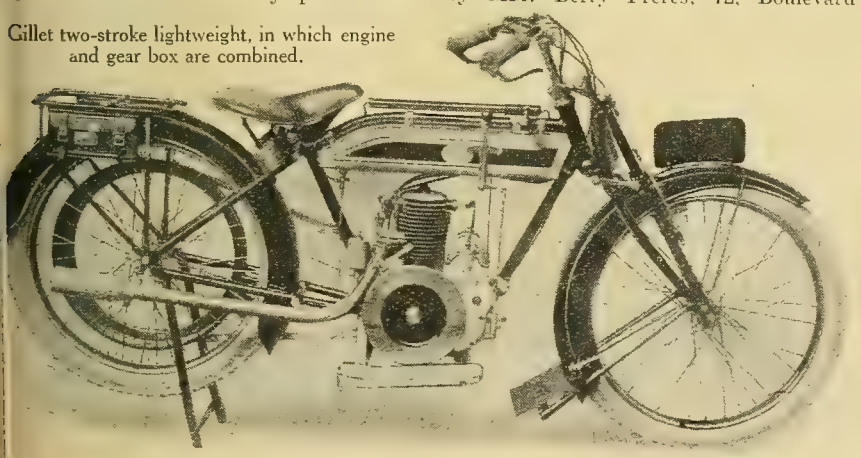
Gillet Two-stroke.

Probably the most interesting two-stroke in the Salon is the Gillet, made by the Société Anonyme des Ateliers Gillet, 546, Rue Hayeneux, Herstal. The three-port engine follows a tendency which is becoming increasingly popular, in that it forms a unit construction with the gear box. Simplicity is the keynote of the design, and altogether only five pinions serve for the two-speed gear (which is of the plain dog clutch variety), the magneto drive, and the kick-starter mechanism, also enclosed in the unit. The kick-starter arm is behind the flywheel, and has a folding pedal, which, when extended, projects clear of the flywheel rim. The piston is heavily drilled to reduce its weight and assist lubrication, while rollers are employed for the big end and the main shaft, which has three ball bearings. Ball bearings are also employed for the gearshafts.

Since the necessary reduction is effected through the gears a good size pulley can be employed, and incorporated with this is the clutch containing four Ferodo discs.

The whole design shows careful thought. The exhaust union is well ribbed so as to assist cooling, and for the same reason the sparking plug faces forwards.

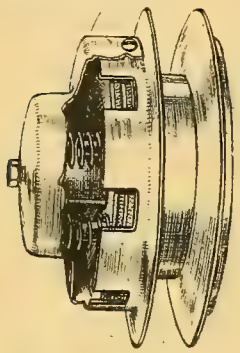
Gillet two-stroke lightweight, in which engine and gear box are combined.



Scooters.

Among the miniature motor cycles there were only two scooters; of these one was the British made Whippet shown by M. Feyens, and the Auto-patinette, consisting of an Auto-wheel mounted in a duplex frame, with disc wheels, shown by B. and B. Motors. There were also two genuine miniature motor cycles, our old

The Brussels Show.—



Gillet combined plate-clutch and pulley.

friend, the J.E.S., shown by M. Aronstein, and the French made Motor-fly.

This latter is quite an original form of attachment. The power plant is a two-stroke engine which is inverted so that the crank case is supported by a bracket extending from the saddle pin of the bicycle, while the cylinder head forms a lug which is connected to the rear wheel spindle. Flywheel and magneto are entirely enclosed, the latter being chain driven. The rear cycle wheel is of the disc variety, and has a leather-covered rim attached to it, to which the drive is conveyed through a flat surfaced pulley on the side of the crank case opposite the flywheel. Pressure by this pulley on the driving rim is exerted by a spring, and means are provided of obtaining "neutral" by pulling against this spring through a control lever on the handle-bar. The engine is controlled by the throttle lever only. The outfit includes a tank fitted with a large filler cap.

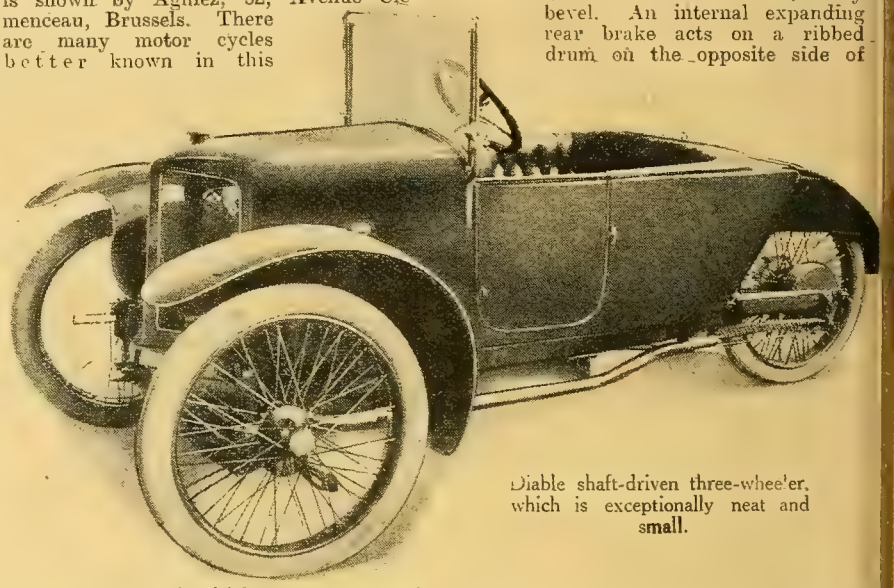
The Sarolea.

Among the Belgian machines to the makers of which England is without doubt in debt owing to their lead in the industry in 1902, mention must be made of the Sarolea made by La Maison Sarolea, Herstal, Liège. The firm started at the very beginning of the movement as manufacturers of engines, and many excellent examples of their products were in use in this country on machines of well-known make.

The modern Sarolea motor cycle is a worthy descendant of such an ancestry. As regards its design, nothing much can be said, except that it has followed a good lead, and has followed it well. The 4 h.p. Sarolea has a single-cylinder engine (85×97 mm.), the best English fittings, and is altogether English in design and equipment, particular attention being paid to comfort and convenience. A totally new model is fitted with all-chain drive, Sturmey-Archer three-speed gear box, and an engine provided with a detachable cylinder head, which, we are told, is not only a convenience for decarbonising, but it has a tendency to keep cooler than the one-piece cylinder casting.

A three-speed gear of the Enfield type is a feature of the Motosacoche—this is the operating lever.

Reference to those motor cycles having more or less unorthodox features is not complete without including the Blériot, an interesting machine with two-cylinder vertical unit engine and gear box which made its *début* at the 1919 Paris Salon. The Blériot sidecar body is shaped like a submarine's hull, and it is interesting to observe that this design is even retained in the tradesman's carrier. It is shown by Aguiez, 92, Avenue Clemenceau, Brussels. There are many motor cycles better known in this country, some of which are represented by agencies in Belgium, and others by their own depots. Of the latter we may mention the Henderson, Douglas, B.S.A., and Harley-Davidson firms.



Diable shaft-driven three-wheeler, which is exceptionally neat and small.

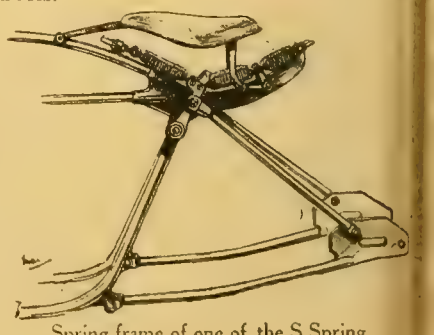
Many other British makes are shown by local representatives, some of whom exhibit several machines. The Ace, the third four-cylinder in the exhibition, is shown by Van Heurck et Cie., 15, Champ Vleminck, Antwerp. The Indian is exhibited by the Indian Import Co., 6, Rue Ledeganok, Antwerp. MM. Berry Frères, 72, Boulvard d'Avroy, Liège, show P. and M. machines as well as Indians. Noterman, 201, Rue Royal, Brussels, Humber, Omega, and Enfield. F. Depuy, 1-3, Chaussée de Bruges, Brussels, King-Dick, Abingdon, and a Sun-Vitesse. Feyens is also showing a 3½ h.p. M.A.G. (Motosacoche) equipped with handle starting and a three-speed Enfield type gear (which has three engine chains), a spring seat-pillar, and an all-metal tool-bag, also a Clyno two-stroke, Royal Ruby, Olympic, Ivy, and Martinsyde. Aronstein is also showing the Cleveland and Sunbeam. Oscar Guillot various types of James machines. Motos Verus et L.M.C., 92, Avenue Louise, Brussels, several examples of these makes. Reinartz, 36, Rue de la Sauvenière, Liège, Reading Standard. R. S. Stokvis et Fils, 141, Rue Royal, Brussels, Rover. B. and B. Motors a 4 h.p. Blackburne. Hobson, Belgium, several Matchless sidecar outfits. There were also two Triumphs—the 4 h.p. and the Junior—the American Excelsior and Ariel.

A Belgian Three-wheeler.

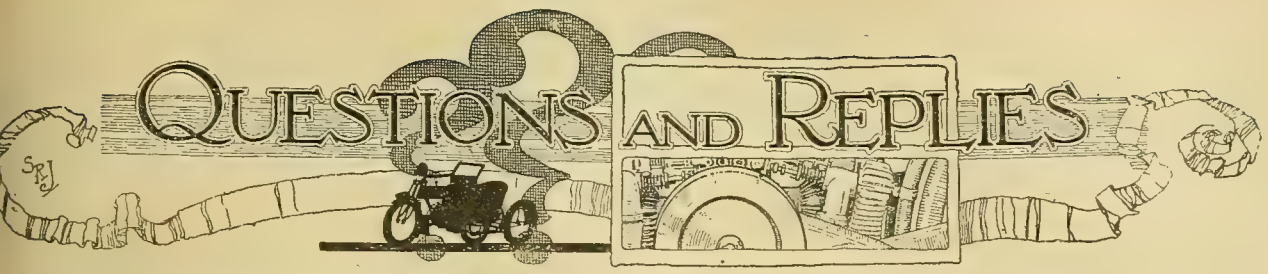
Among the cycle cars may be mentioned the Diable three-wheeler, in which are incorporated several features of modern design. So far as general arrangement is concerned, the usual three-wheeler practice is followed, but the unit system is employed; the crank case arms form part of the unit, and serve to attach the engine to the frame, while the gear box has three speeds and the reverse.

From the gear box to the rear wheel the drive is through an enclosed propeller-shaft with a universal joint at the forward end, while the final drive is by bevel. An internal expanding rear brake acts on a ribbed drum on the opposite side of the wheel to the bevel. It is exhibited by Altero-cycle Pilotier, 45, Avenue Jean Volders, Brussels.

There is one four-wheeler which is worthy of mention as being of interest to motor cyclists, and that is the tiny 8 h.p. four-cylinder Peugeot, which may one day prove a competitor to the motor cycle and sidecar. It has a small four-cylinder engine, with inlet and exhaust valves under a single valve cap on each cylinder. The cooling is by thermo-syphon, and the steering gear box is close up against the radiator, so as to accommodate the steering column, which approaches the horizontal, and goes straight through the dash, running over and well clear of the engine. The frame is of a single channel steel pressing, forming the floorboards of the body. The drive from the clutch is by propeller-shaft to the worm-driven rear axle, the two-speed and reverse gear box forming part of the axle casing. The chassis is suspended on a transverse spring in front and quarter-elliptic springs at the rear. It is exhibited by Automobiles Peugeot, Paris.



Spring frame of one of the S Spring machines.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of envelope, and should be kept distinct from questions bearing on technical subjects.

Ignition Timing.

(1.) My machine is an 8 h.p. twin Chater-Lea 1912-14. Should the spark occur at the dead centre when fully retarded? (2.) If not, how much before dead centre hould it occur?—R.F.G.

) The spark should occur at the top id centre when the magneto control is o-thirds retarded. (2.) Nothing is to gained by timing the magneto in rance of this, provided the magneto has riable ignition.

Position of Sidecar Wheel.

As I am very suspicious of the alignment of my outfit, I would like to know the correct method to adopt to get the sidecar wheel exactly opposite the back wheel of the motor cycle.—A.L.

the axle connection of your sidecar s in the usual way on the stay of the otor cycle, it would appear that the ly means to bring the sidecar axle direct line with the back wheel axle to use a cranked member for the achment at the stay. Some sidecars ve such a connection, but if you conplate altering your existing sidecar should not be a very expensive matter.

Neutral Position of Gear.

I have just purchased a 2¾ h.p. two-stroke motor cycle (Villiers engine), and it is fitted with an Albion two-speed gear (high, low, and neutral). I am not experiencing any trouble, but what I want to know is whether I am right, when the engine is running in neutral position, to put the gear gently into low speed in order to start the cycle moving, and then next into high gear. If neutral position is not for this purpose, what is the advantage of having it? I have, of course, tried the above, but the machine moves off with some difficulty.—W.W.

is not desirable to engage either top low speed when the engine is running th the gear in a neutral position, unss some "way" is got on the machine fore engagement is made. It would rtainly do harm to place the gear in v speed position slowly, as you appear have done, as the gear box is of the g clutch type, and the gear is either or out. Consequently a start from standstill cannot properly be made means of engaging the gears. A utral position in a plain two-speed x is merely incidental, and cannot be de much use of at any time.

Designing a Twin Two-stroke.

I am designing a flat twin two-stroke engine to have a firing stroke each half revolution of the crankshaft. This will put both cranks on the same plane, and I am a bit puzzled as to how I shall balance it to overcome vibration, so will you please give me some idea to work on?—J.H.R.

You will find it very difficult to balance satisfactorily the engine which you describe, as the weight of the reciprocating masses is very high. It would be much better to make an engine with side-by-side cylinders and cranks set at 180°, when the balance (with the exception of a horizontal couple) is almost perfect. The firing intervals, of course, would be those which you require.

IMPORTANT DATES.

Dec. 10th-19th—
Brussels Show.

Dec 27th-28th—
M.C.C. London-Exeter Run.

Jan. 28th to Feb. 5th, 1921—
Scottish Motor Exhibition, Kelvin Hall, Glasgow.

Loss of Compression.

(1.) My two-stroke engine has started to lose power especially on hills, and also takes considerable time to pick up speed on the level. (2.) I have fitted a new piston ring at the top of the piston, thinking this would remedy the above, but without satisfactory results, excepting when the engine is cold, then there is an improvement, but on getting warm the power falls off. (3.) Please state the correct way to grind in piston rings.—F.G.F.

(1.) The trouble is probably due to leakage of compression; this may be due to worn main bearings, worn piston or piston rings, or to defective joints between the cylinder and crank case, or between the two halves of the crank case. (2.) If the piston is much worn, a new ring will not improve matters very much. (3.) It is not advisable to grind in the piston rings; it is much better to run the machine carefully for fifty or sixty miles, during which distance the compression will gradually improve.

Ignition Timing and Lubrication.

I have a 3½ h.p. single-cylinder water-cooled engine which I am using as a stationary power unit. The ignition is fixed, and is by accumulator and coil. (1.) Could you advise me as to the amount of lead I should give the piston in timing the ignition, so as not to risk a backfire, and yet give perfect running for the purpose required? (2.) The oiling is by drip feed. How many drops per minute should I set this to?—S.H.B.

(1.) You do not state the stroke of the engine, therefore we cannot give you a definite figure; but, if the stroke does not exceed 88 mm., about 5 mm. of advance should be quite safe. (2.) Without knowing the engine, it is impossible to tell you how to set the drip feed, but you might try thirty drops per minute, and if there is any overheating after running for, say, half an hour, you can increase the supply, or, if the exhaust smokes, decrease it.

Valve Timing for Efficiency.

What are the exact positions of opening and closing of inlet and exhaust valves, which are conducive to greatest efficiency, also what margin of adjustment would be advisable to allow in manufacturing? I am working out the details for a new system of valves for petrol engines, and would be very greatly obliged for these particulars. Perhaps the best thing would be to tell me the earliest and latest positions for the opening and closing of each valve. Also will you please say what area would the inlet and outlet need to be if a clear valve way were made, *i.e.*, the smallest and most efficient size of hole or clear opening through which the cylinder could be fed and discharged, say for 2½, 3½, 4, 5-6, and 7 h.p.—W.S.

It is impossible to give you any definite statement regarding the exact moment of opening and closing of the valves, as these vary between very wide limits, according to the design of the engine. For instance, an inlet valve might open as much as 15° early, and close 50° late, although mostly the inlet valve opens about the top dead centre of the stroke. In the same way, the opening of exhaust valves may vary between 30° and 75° early, and the closing may be anything between top dead centre and 15° late. Your second question is a matter which is entirely dependent upon the design of ports, lift of valves, and piston speeds.

Paraffin-benzole Mixture.

(1.) Can I use half benzole and half paraffin if I used a petrol injection device to start the engine? (2.) Is it possible to fit 26in. × 2in. tyres on 26in. × 1¾in. wheels?—C.J.E.

(1.) You would probably find that you could start on a mixture of half benzole and paraffin even without the use of any special starting device except in the very coldest weather. (2.) You could not fix tyres of 2in. section on 1¾in. cycle wheels.

Hub Gear Troubles.

I have a 3½ h.p. Ariel, fitted with a three-speed Mark VII. Armstrong hub gear. Every time I use the low or middle gear two of the teeth are shorn off the spindle. Can you say where the trouble lies? I am very careful with it—always lift exhaust lever when changing, run engine at suitable speed, and the spindle itself cannot shift.—R.R.

Probably the trouble is due to the spindle being of unsuitable material. The Armstrong Mark VII. hub gear gave satisfaction when retained in correct adjustment, but the original makers went out of business in 1914.

Petroil Lubrication.

My machine is a 1914 Royal Ruby-Villiers two-stroke with petroil lubrication. Will you kindly tell me what grade oil and what proportion to petrol is likely to give best results? I have just purchased one gallon of Gargoyle B. Is this suitable?—B.M.B.

Any good air-cooled oil, mixed in the proportion of eight to twelve to one will give the desired results. The oil you mention is quite suitable.

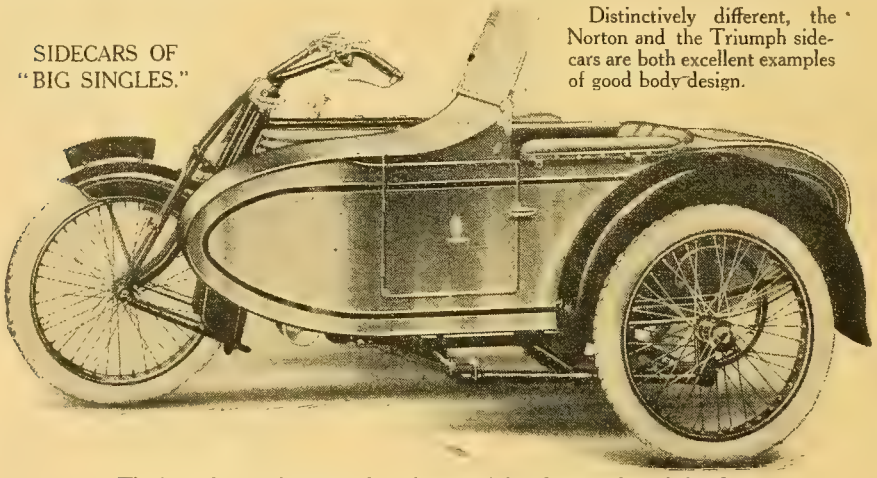
Advertising Second-hand Machine.

Will you kindly give me your opinion of the best method of advertising a motor cycle? (1.) The best type of advertisement. (2.) Any special points to take into consideration in framing it. (3.) The best way to make it attractive. The reason for asking these questions is because I continually notice in your paper advertisements which seem insufficient and unconvincing.—T.C.B.

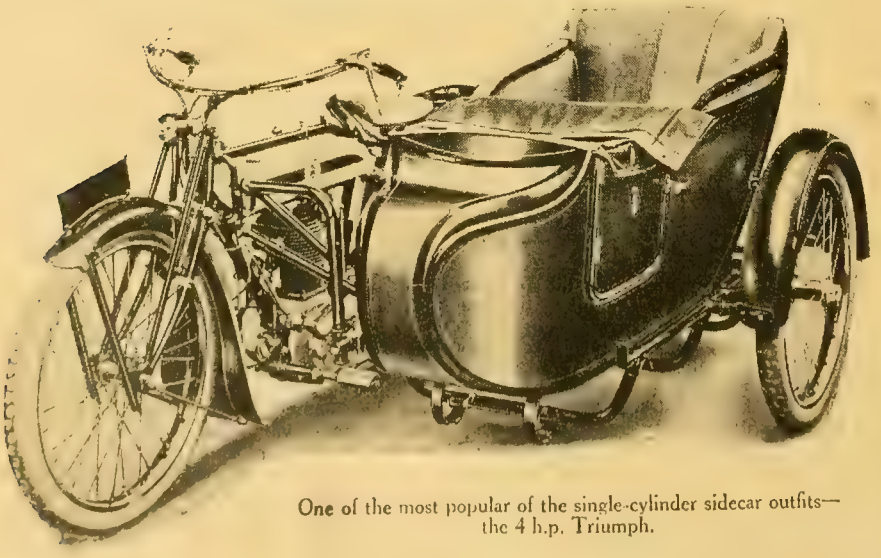
(1 and 2.) Give the engine, gear box, and frame numbers of your machine, the date of manufacture, the model, and date of purchase, full details as to equipment, mileage, and general condition, and, of course, the price at which you wish to sell. (3.) The only way to make an advertisement attractive is to take the public into your confidence by giving the fullest possible details. For example, do not forget to say whether it has a hub gear if this is the fact. On the other hand, if it is a countershaft model make the most of it.

SIDECARS OF "BIG SINGLES."

Distinctively different, the Norton and the Triumph sidecars are both excellent examples of good body design.



The immediate and most striking feature of the Norton sidecar is its clean design and symmetrical appearance.



One of the most popular of the single-cylinder sidecar outfits—the 4 h.p. Triumph.

READERS' REPLIES.

Extraordinary Plug Trouble.

Re the above matter, raised in your Show Report issue; "E.M." suffers from a trouble I used to have on a similar machine. Unfortunately I can display quite a number of various makes of plugs as evidence of my sufferings. Some time ago I tried—almost in desperation—the Aviation K.L.G. plug, and now all troubles of this nature have vanished. These plugs are expensive, but I have found nothing to stand up to my engine in the same way. Since installing them, my Rudge has travelled over 3,000 miles without a change of plug.—H. T. Brown.

Burnt Valves.

In your issue of October 28th a Rudge rider, "B.S."—under the above heading—describes his woes. I believe I can be of some little assistance to him, for I had the same trouble, and burnt out three valves in very little time, then I bought a new valve guide from the makers, and until I read of "B.S.'s" appeal for help I had forgotten that it was even possible to have a burnt-out valve.—H. T. Brown.

RECOMMENDED ROUTE.

Brigg to Chatsworth.—F.R.

Brigg, Scawby, Messingham, Blyton, Gainsborough, Saundby, E. Retford, Worksop, Whitwell, Staveley, Brimington, Sheepbridge, Baslow, Edensor, Chatsworth.

Ripon to Rochford and Back.—C.C.

Ripon, Boroughbridge, York, Market Weighton, Beverley, Hull, ferry to New Holland, Ulceby, Harborough, Great Coates, Great Grimsby, Louth, Horncastle, Donington, Spalding, Peterborough, Stilton, Huntingdon, Godmanchester, Caxton, Royston, Buntingford, Bishop Stortford, White Roding, Chelmsford, Rayleigh, Rochford. Return by the route given to Huntingdon, then go through Stilton, Wansford, Stamford, Grantham, Newark, Tuxford, Retford, Bawtry, Doncaster, Ferrybridge, Aberford, Wetherby, Boroughbridge, Ripon.

Worthing to Leicester.—A.D.

1921.

For 1921 we are concentrating on an exceptionally high-class 2¾ h.p. Solo Motor Cycle and a 4 h.p. model which is suitable alike for Solo or Sidecar work. The engine used in each case is the BLACKBURNE, and we have not succumbed to the temptation of fitting the higher powered engine into the Lightweight frame, or vice-versa. The two models are separate and distinct, each being specifically designed for its own particular purpose.

The prices are 99 Guineas and 120 Guineas respectively, and we guarantee THESE PRICES TO REMAIN CONSTANT TILL MARCH 1921. Highly finished, luxuriously equipped, and efficient to the last degree, we claim each to be the best in its class on the market.

THE MOTOR CYCLE ROUTE BOOK

With Road Maps of England & Wales, Scotland, and the London District

A WELCOME departure from the stereotyped form of road book is made in "THE MOTOR CYCLE" ROUTE BOOK. In addition to the usual routes from London, radiating main routes are given from other large and populous centres in England and Wales, and Scotland, as well as "linking-up" routes from all other cities and towns of fair size. The intersecting or linking-up routes are clearly shown by reference numbers. The items of interest on the main roads are described by the well-known authority on roads, Mr. Chas. G. Harper. A useful set of Maps of England, Wales, and Scotland, in Atlas form, and printed in red and black, is included.

Price 5/- net. **By Post, 5/6.**

List of Contents

Radiating Routes from Large and Populous Towns, Traffic-avoiding Routes, and Routes into and out of London.
Linking-up Routes from and to smaller Towns.
List of Ferries in England, Wales, and Scotland, with their charges.
List of Speed Limits in Various Counties
Lighting up Time Table.
Also 32-page MAP SECTION.

Obtainable from ILIFFE & SONS LTD., 20, TUDOR STREET, LONDON, E.C.4

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., & Co. and crossed Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements the mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt. The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited. The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

NEW LICENCE HOLDER 5/-

POST FREE.

These holders are made of aluminium and conform to Government regulations. When ordering please state whether required for attaching to motor cycle, sidecar, or car.

Under the new Licencing Regulations which come into force on 1st Jan., 1921, *every* motor vehicle must carry the new licence card in a specified position *on the vehicle*. For this purpose, a waterproof holder with glass front is necessary, so we have stocked a large quantity of these to meet the enormous demand that will be made for them before the end of this month.

Orders accompanied by Postal Order 5/- will be executed in strict rotation.

THE EASTERN GARAGE COMPANY.

DAVIS'

Ustikon

PATENT

SOLES & HEELS

No matter what world conditions make them cost you, we have continued to base Ustikon sole prices on actual shoe values—on what we put into Ustikon Soles—on what you get out of them—full value for what you pay.

No apparatus is necessary, nails or screws are obviated, and moreover, you get a sole that is absolutely waterproof. Surely Ustikon Soles are worth consideration.

Consider the wear not the price per pair.

GENTS', all sizes 3/9
LADIES', all sizes.. .. 2/9

Complete with Sol-fix and directions.

USTIKON HEELS

The wearing quality of these Heels is indicated by th fine workmanship and careful finish. In actual wear they are still better than you expect.

The "IVY" TWO STROKE

We are placing on the Market, as from the Olympia Show, a 3 h.p. (350 C.C.) two-stroke Sidecar Combination, and in order to demonstrate its capabilities, we carried out a severe test on the Old Wyche Cutting, Malvern (see copy of draft certificate below, in course of preparation by the Auto Cycle Union.

The Ivy "Three" Again.

Sole Manufacturers:
S. A. NEWMAN, Ltd.,
IVY Motors, Aston Cross, BIRMINGHAM.

AUTO CYCLE UNION,
83, PALL MALL,
LONDON, S.W.1.
2nd Nov., 1920.

CERTIFIED TRIAL of 3 h.p. (350 c.c.) IVY TWO-STROKE & SIDECAR.

On the 28th of October, 1920, a 3 h.p. IVY two-stroke and Sidecar, fitted with a 350 C.C. IVY Engine, made **15** consecutive clean ascents, non-stop, of the Old Wyche Cutting, at Malvern, with a passenger in the sidecar, the driver being Mr. Percy Newman. In addition to this, an extra passenger was carried for two further ascents, the machine being brought to rest while the passenger mounted to his place, during which time the engine was not stopped. The weight of the outfit, complete, with driver and passenger, was 5½ cwt.; on the 16th ascent, the extra weight of the second passenger brought this up to 6¾ cwt., and during the 17th ascent, up to 7 cwt. At the conclusion of the trial, the engine showed no signs of overheating. The trial was carried out in fine weather, with no appreciable wind, and the road surface was good

Yours faithfully,
G DIXON SPAIN.
Assistant Secretary.

R. D. VARTY for Tyres.—New unused Dunlop heavy studded 26×2¼, 37/6; 26×2⅜, 37/6; two only 28×3 extra heavy, 47/6 each; also others at clearance prices, all sizes from 24×2, only a few left, don't delay —R. D. Varty, Thundersley, Essex. [37

A 26×2¼in. High-class Rubber-studded Cover, straight from the factory, for 30/-; just think of it; no clearance; money refunded if not satisfied. Have one of these bargains. Send for our repairs and retreading list.—Melton Rubber Works, Melton Mowbray. [03

26×2½ New Beaded Covers, 30/-; new best quality tubes, 24×2¼, 6/-; 26×2, 6/6; 26×2¼, 7/ 26×2½, 7/9; 26×2½×2¼, 8/6; 26×3, 9/6; 700×8 10/6; 750×75, 12/6; new rubber belts, 6ft. 2in.×1i 10/6; 15in. inflators, 2/6; sent approval; carriage pa receipt remittance.—Palmer's Garage, Tooting, S.W. [38

BARGAINS.—Seven days' approval; limited numb only: Englebert 26×2¼ heavy rubber-studd passenger 30/- (list 46/3), touring 35/6 (list 53/ solo 34/6 (list 49/-); Avon 3-ribbed, 20/3 (list 25/ plus postage 1/-; tube, 8/6 (list 12/-). Repairs, kinds, to tyres and tubes.—Armstrong, 17, Goldha Rd., Shepherd's Bush, London. [35

MOTOR Cycle Tubes.—Best red quality, with sm patch vulcanised by makers: 24×2, 5/3; 2 2¼, 5/6; 26×2, 5/9; 26×2¼, 6/-; 26×2⅜, 6/3; 2 2½, 6/6; 26×2½×2¼, 6/9; 26×3, 7/-; 28×2, 7/ 28×3, 7/6; 29×3½, 7/9; 650×65, 8/-. All leadi makes and sizes in stock.—H. Emanuel, Tyre Fact 27, Belgrade Rd., N.16. Stores, 37a, Balls Pond R 'Phone: Dalston 3161. [03

GOVERNMENT Surplus.—Huge stock of specia selected second-hand covers, Dunlop heavy, H mers, Kempshalls, Clinchers, etc., 26×2¼, 26×2⅜, 1 each; 28×3, 17/6 each; new Dunlop and Bates tri 26×2¼, 2⅜, and 2½, 7/6 each; special line of 700 grooved rebuilt covers, 40/- each; goods cash proval.—Homerton Rubber Works, Brooksbys W Homerton, E.9. 'Phone: Dalston 3483. 'Grams: Em rubwor, Hack., London. [03

Greetings!

ONCE again the festive season is upon us, and in spite of the difficulties which beset the motor cyclist the interest in his favourite pastime never slackens. High prices, increased taxation and paraded licences all produce their quota of grumbles, but serious as they are, the true motor cyclist is as keen as ever. There is no more enthusiastic body in the world than the army of riders who use their machines throughout the year, and who help to support the keenest, cleanest sport in the world.

To all good riders, whether they be competition men, those who ride for business purposes or week-end pleasure, to manufacturers, traders, and purchasers alike, *The Motor Cycle* extends its heartiest Christmas greetings, and assures them that it will continue to support all that is in the best interests of the finest and most exhilarating pastime in the world.

Standardised Controls.

AGAIN a move is being made to bring about standardisation of controls. For ten years or more we have been urging that attention be paid to this point, and from time to time we have approached various organisations such as the A.C.U., the Manufacturers' Union, and the Engineering Standards Committee, on the matter. Now a sub-committee of the A.C.U. has made a recommendation for the standardisation of such items as carburetter and brake levers, but, although the effort being made to interest the manufacturers concerned is a step in the right direction, motor cyclists must not think that the matter is settled, and that in future uniform controls will be found on every new machine they purchase.

It still remains a question for the makers to consider, and while we know serious efforts will be made by the management of the Manufacturers' Union to bring the question before its members, it is by no means certain that sufficient support will be given to the idea—or, if given, that an agreement can be made between, say, the various makers of carburetters.

As pointed out in our leaderette in the issue for August 19th last, there is a diversity of opinion as to which is the better way for a carburetter lever to open, inwards or outwards.

Of the several points where standardisation is desirable, the position of the brake levers and the direction of opening the carburetter levers are the most important, and probably the best way to bring about ultimate standardisation of controls throughout the machine will be for the Manufacturers' Union to concentrate on one of the important points mentioned.

Standardise Carburetter Controls First.

Carburetter controls probably represent the easier proposition, as they not only affect a comparatively small number of makers, but are not such a large undertaking as other items. It will be appreciated that, even should the manufacturers come to a decision, standardisation must take some considerable time to come into effect, as in many cases it would mean redesigning certain details. Manufacturers could not be expected to do this excepting in an entirely new model, as it will be found that the *raison d'être* of existing control positions is that they have been considered to be the most convenient.

The recommendations of the A.C.U. Committee conform in the main with those which we submitted to the Manufacturers' Union some time ago, but with this significant change, *i.e.*, it is recommended that the foot brake be on the right side of the machine. It is difficult to see why this suggestion has been made, since the majority of kick-starter pedals are on this side of the machine. When a motor cyclist stops his engine on ascending a hill, the difficulty of re-starting with both brake and kick-starter on the same side has to be experienced to be fully appreciated.

An index to the advertisements in this issue will be found on the page facing the back cover

OCCASIONAL COMMENTS

BY IXION

Valves.

AT the Show I met a manufacturer whose speciality is valves on the grand scale. To the best of his belief the A.B.C. was the only 1920 motor cycle fitted with valves made of stainless steel, which never break, stretch, or burn. There is some excuse for this, since—quoting taken figures—a stainless valve may cost 300% more than a 3% nickel steel valve, as this steel is too hard for cheap production. On the other hand he delivered himself of an amazing dictum. By paying approximately 6d. extra per valve, it is possible to get a valve which is infinitely more reliable and satisfactory than 3% nickel steel. Yet hardly any firms in the industry will spring the extra cost, even for their exhaust valves.

The B.T.H. Lighting Outfit.

CASUAL visitors to the Show missed the B.T.H. lighting set, which was on J. A. Ryley's stand in the Gallery. It is the lightest and cheapest outfit of the type up to date, but at present is only ready in its baby two-stroke edition. The "idle maximum" of the magneto armature is tapped by a pick-up on the contact breaker and led to a battery mounted in the rear prong of the lamp bracket. It charges at .65 ampère, whereas a 4 c.p. head lamp and 2 c.p. tail lamp discharge the battery at .9 ampère. It follows that the set, though unsuitable for night work exclusively, should prove perfectly efficient for machines which do three hours by day for each hour which they travel by lamplight.

Long Life from Dry Batteries.

I AM not enough of an electrician to deal faithfully with our optimistic correspondents who claim satisfactory lighting service from dry batteries. It may be possible under the best conditions to obtain eighty lamp hours from a single small battery—I do not know. But I know this. Both as a private individual and in the semi-trade position of a technical journalist, I have obtained a number of dry battery sets from various firms who specialise in such outfits, and, though I have often had tolerable results, my uniform experience has been that the convenience of the system does not outweigh its cost. I confess that I still occasionally employ dry batteries for tail lamps, and, with luck, hope to get twenty hours out of them. I do not average anything like that period. I occasionally get the wind up when batteries give out unexpectedly soon. But for intermittent short distance work, they are, taking them all round, better than anything else, and worth their cost. Still, I have never had one solitary battery which suggested to me that this form of lighting could possibly be regarded as cheap. On the other hand, we have not all got dynamos. I do not know of a decent paraffin or candle tail lamp. And the acetylene tail lamp, as we all know, is a constant source of anxiety, though it can behave nicely on occasions. For real tail lamp joy, give me a dynamo outfit. If you carry a spare bulb, there is nothing to worry about.

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

About Toolbags.

I DON'T often travel by the slow and expensive train, but the other day Nemesis fell upon me, and I had to wait an hour at Bristol station. Beguiling the tedium, I spotted a brand new Douglas *en route* to some lucky man, and I noticed that it was fitted with the widest toolbags I have seen for a month of Sundays. They were long enough to accommodate a set of car tyre levers, and were equipped with strap fasteners. An F.N. enthusiast writes his praise of the toolbags fitted to the last edition of the famous four-cylinder. They are of the all-metal type, and the usual lock and key is supplemented by a spring tongue fastener secured by a milled nut. In other words, they cannot lose their shape, they don't jolt open on the road, and you can lock them when you store the machine. These obvious ideals are not recognised by all designers.

Through Signposting.

ON the question of signposting. Through signposting is at present left to local authorities (with very few exceptions, such as the Great North Road), and they carry it out with a great lack of imagination and efficiency. When you pobble into a strange town, you never know if it will be signposted or not, nor how, nor where. A few towns have intelligent and striking direction posts or boards. Some have faded legends painted before the war on garden walls half-way round corners. Some have curved scrollwork, engrossed with floriated lettering, in any convenient public place. I cannot at the moment name a single large town through which a stranger could hope to pass without repeated dismounts. There are four main requisites, viz.:

1. Every possibility of a false turn should be safeguarded.
2. Switch routes avoiding traffic vortices should be indicated where they exist.
3. The panels should be large. (Lettering of the village signpost size is useless.)
4. Distinctive colouring should be used in order to catch the eye (say yellow and black).

The Licence Pother.

I AM not quite as down upon the Transport Ministry as some grumblers. Their scheme is apparently plotted with several aims in view:

1. To keep tab of motor thieves. (I see nothing to prevent the forgery of both licence cards and log-books; and many difficulties in the way of swift and sure detection of such forgeries. But an additional safeguard is certainly provided.)

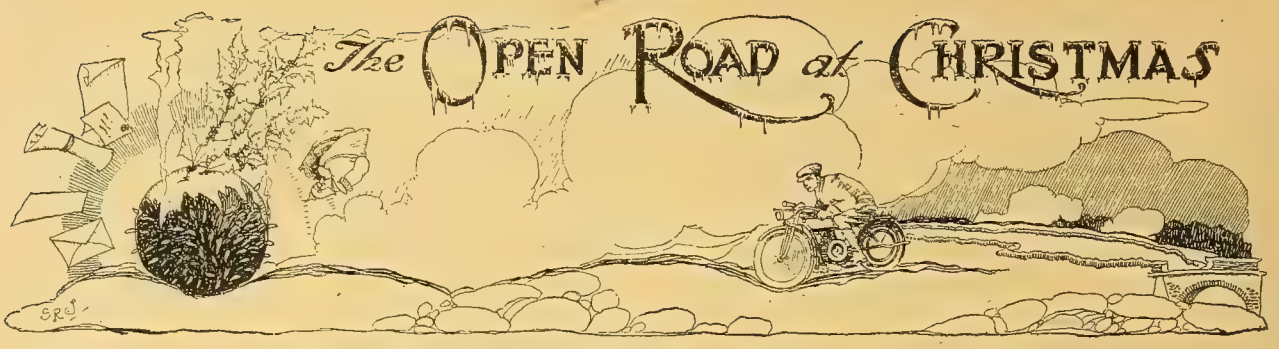
2. To collect revenue cheaply, and to prevent fraud through the use of unlicensed vehicles. (Only those behind the scenes know how much time and postage has been wasted in the effort to track down motors which have changed hands repeatedly, or how many motors are trotting about under fictitious numbers, or numbers which do not belong to them.)

3. To estimate the revenue from a given taxation scheme. (At present nobody knows with any close accuracy how many cars and motor cycles there are on the road; hundreds of "numbers" have fallen into disuse without ever being officially cancelled.)

But there are a few details on which no superman has yet cast his eagle eye. For example, why can a car be licensed for three months at a time, whereas the humble motor cyclist must *(a)* dub up a full year's money in one mouthful, and *(b)* pay a year's tax even if he does not buy his 'bus till September? Again, a three-wheeler scaling over 8 cwt. may, apparently, enjoy the benefits of a quarterly licence, whereas a three-wheeler weighing under 8 cwt. may not. So far no regulations seem to have been issued or any penalties inflicted for failure to notify the decease of a 'bus which is written off. There will be a stir at the Transport Ministry in January should my 1921 'bus get to the ground, card, logbook, and all. Before long death certificates with an adequate fee will doubtless be added to the scheme.

"Productibility."

NOT quite a flying kilometre sort of word, I admit, but I have known worse. I met a chappie at the Show with that air of mild curiosity which marks the technical journalist. "Who are you for?" I enquired, scenting a new paper. He explained that he had been chartered by an American firm of technical publishers to report to the U.S.A. motor cycle trade on any special items of design in our machines which might make for cheap and easy mass production. "What's doing?" was my next impertinence. He grinned, and allowed me to scan a sheaf of notes. I have never tackled a Show from this particular viewpoint, and I must confess that his analysis was not encouraging. He was particularly critical of our twin-cylinders, and wished to know what hidden reason prevented the two cylinders from being interchangeable in so many cases. But he also waxed rather merry about some items of single-cylinder design, having unearthed tappets, etc., that were not interchangeable.



Pleasures Awheel during the Christmas Holidays.

ANY motor cyclist who has used his machine at Christmas time must retain memories of the road that are distinct from all others, however pleasurable they may be.

There are hundreds of motor cyclists who have competed in the run from London to Exeter, in fact the enthusiast considers that the motor cyclist's education is not complete until he has taken part in this classic event. There are also other Christmas events of this nature, and those who have participated in them naturally draw upon their experiences when the question of Christmas rides is discussed.

It is not, however, such rides as these that inspire the title of these notes, as the writer's experiences in a London-Exeter were neither in keeping with the season nor worthy of retention as pleasant memories.

On Christmas Duty.

The Yuletide experiences of the average motor cyclist are totally different from those of the competition rider. His rides generally have a definite object, although sometimes when the sun gives a sparkle to the frost he may forsake his fireside for a run into the country merely for the sake of the ride. More usually, the Christmas rides are made awheel in lieu of trains, trams, or "Shanks's pony." Sometimes it is an exile who uses his machine to get to the home of his people.

What owner of a sidecar cannot find employment for his outfit during the Christmas holidays? The turkey, the cakes, the case of wine which harassed shopkeepers have forgotten to send are quickly rounded up. The holly, and with great luck, the mistletoe also, can be fetched from off the commons to become something associated with the country instead of with the florists' shops.

Families are often scattered, and Christmas is regarded as a suitable time for an annual reunion at the "old home." Those of the clan who possess motor cycles almost inevitably use them for the journey, which, under favourable weather conditions, is by no means the least enjoyable feature of the holiday. Given a snow-bound road and a kindly sun, the greatest lover of the fireside wonders why winter riding is not more general.

A Trip in Imagination.

Imagine the journey on a sunny Christmas morning when the roads are hard with frost. Imagine the loading of the sidecar with human freight and the locker filled with the inevitable parcels with which we burden ourselves at Christmastide. Imagine the good wishes of your neighbours when you set off. Further, in imagination, "start her up," let in the clutch and away in the smiling morn—perhaps only to return a few minutes later to make sure that the cat has not been locked in the house, or that the pantry window *has* been fastened.

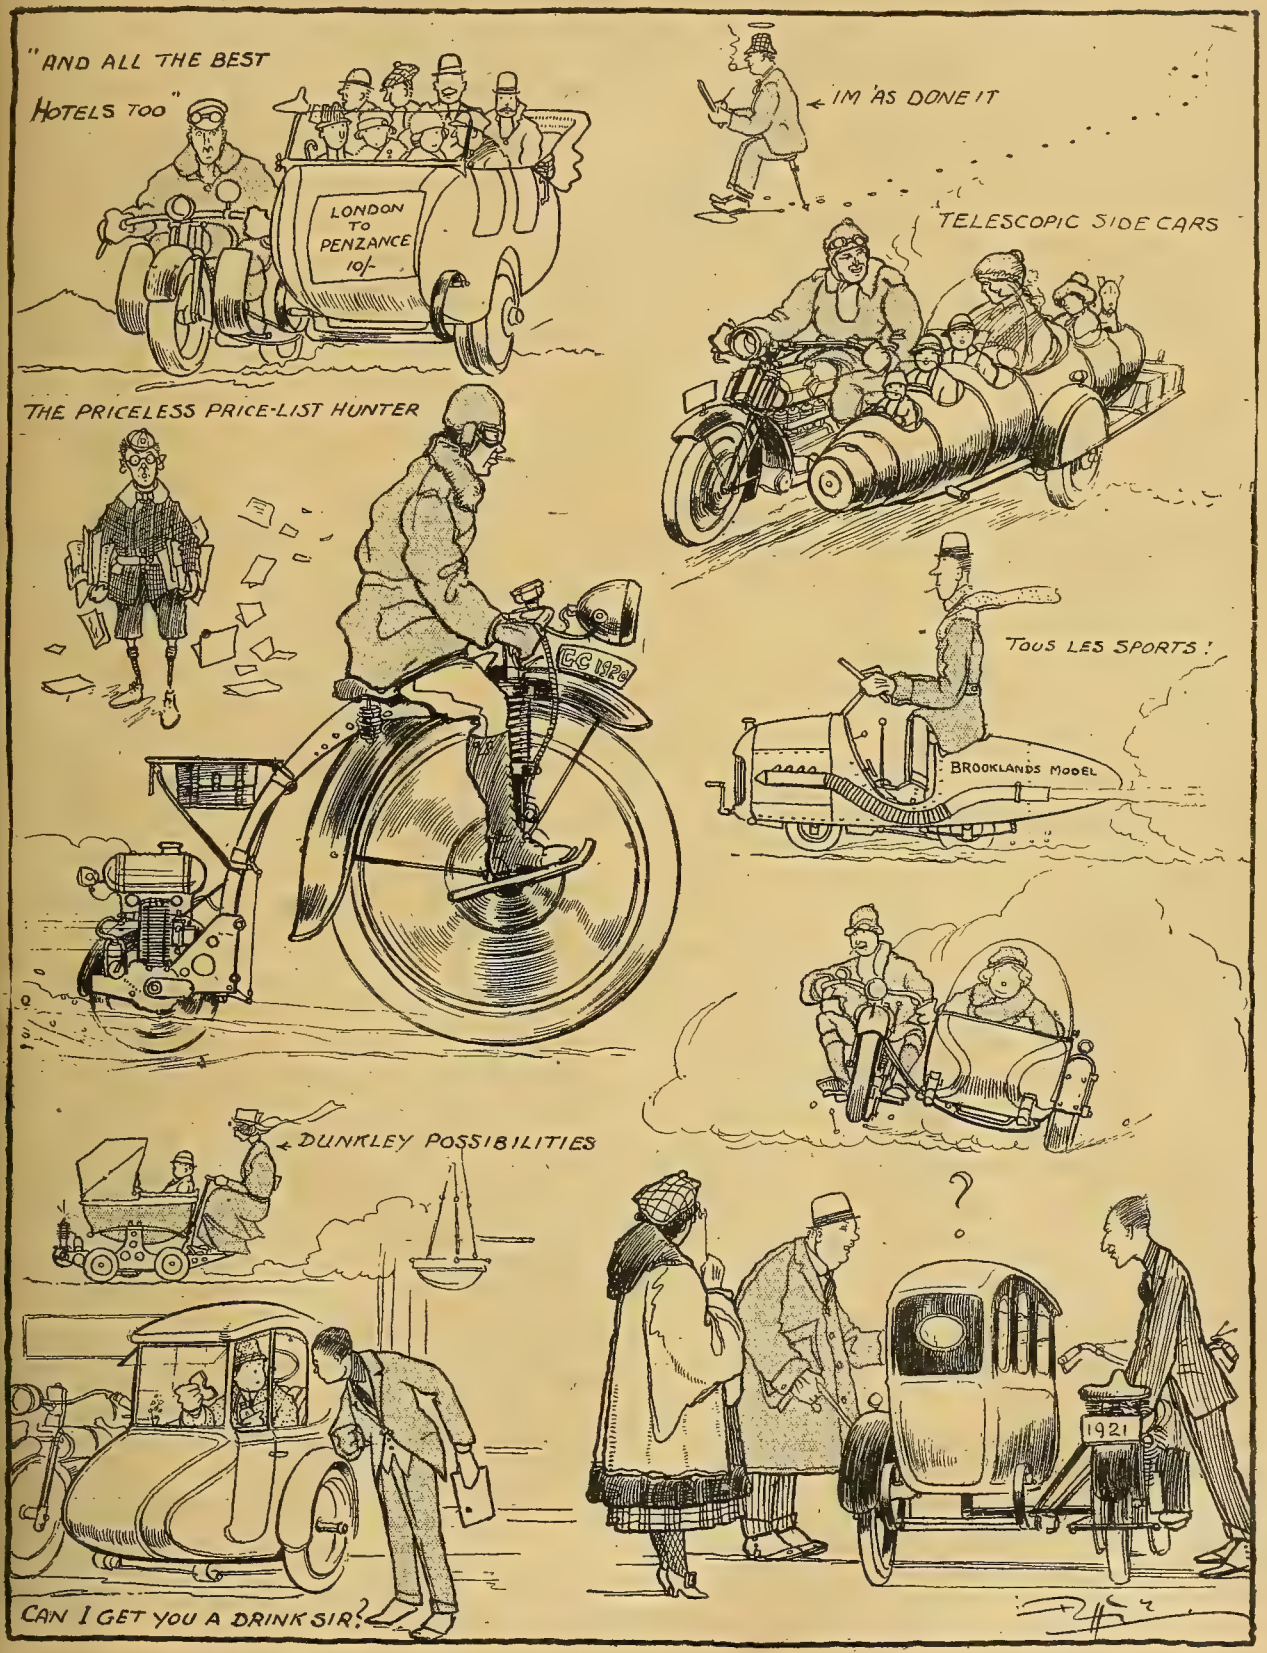
The whole world is animated by a universal good will. There are smiles on the face of everyone—and across the glistening village streets, stranger hails stranger with "a Merry Christmas." You may call at a familiar half-way house, just to give mine host and hostess "the compliments of the season," then off again. There's a blazing fire and a hearty welcome awaiting at the journey's end.

Imagine it all, you who stay at home, and you must envy the man who has to take to the open road at Christmas.

PREPARING FOR CHRISTMAS.
Gathering evergreens during last week's spell of snow.

MOTOROSITIES!

OUR ARTIST IN A CYNICAL MOOD—SOME SHOW INSPIRATIONS.



Opportunity knocks Once at every Man's Door, and on this Occasion our Hero was "at Home."

THAT conceited ass Rutherford swaggered down the steps of the golf pavilion just at the wrong moment. I hate men who wear M.C. ribbons on civvy waistcoats. I shouldn't if I'd been old enough to fight in the war.

"I like men who *do* things," murmured Dolly, cruelly nipping in the bud my attempt to propose for the *n*th time.

She looked achingly pretty, as she leant back in the deck chair. Eyes of delphinium blue. Twisty little curls, as yellow as a cornfield in June, before sun and wind have browned it to reddy gold. A nose which would have been straight if its tip hadn't just a quarter of a mind to be saucy. A slender little neck, and a figure as graceful in repose as it was lovely in movement. What an exasperating vision for cruel old Dame Nature to dangle before a youthful bank clerk with an affectionate nature and no prospects. Add a clever little head, the heart of a sportsman, and the jolliest girl nature in the whole world—then you can picture my enslavement.

"For the last time, Dolly," I demanded desperately, "will you give me a proper answer?"

Another Refusal.

She threw away her cigarette, leant forward with her elbows on her knees, and looked me straight in the eyes as a pal should.

"Look here, old boy," she said almost tenderly, "I like you awfully. Better than anybody else, perhaps. I could easily like you better still, if I let myself go. But we can't. I'm an outdoor girl, and as expensive as they make them. Dad's spoilt me. I've had nothing but the best since I left the nursery. If I were idiot enough to say 'Yes,' what would there be in front of us? You wouldn't let dad keep us if he could, and since the war his 'divis' are down so that he couldn't help if he wanted to. It takes him all his time to keep the Hall going. You're earning, I suppose, £200 a year, and not saving a farthing. I've spent that, and more than that, on frocks and golf every year since I came out. You won't earn much more than that till you're a cashier—ten years hence. I don't say I couldn't pinch and live in a dreadful little villa for the man I loved. Every girl could, and I would. But we couldn't be married at all for ten years, and even then—why, you'd be at the bank all day, and I should be cooking and scrubbing; and then there'd be cradles and—er—things. I daresay I could face it all to-morrow, but to wait ten years with only a poky little home and all the household jobs which I *hate* at the end of it—it isn't fair to ask a sporting girl to face that. I can't do it, and once for all, it's a great big 'No.' I wish it could be 'Yes,' old boy, but you must see it can't. So don't ask me again! And I'm not going to knock about with you so much if you can't be sensible. For instance, our round this evening had better be off, don't you think?"

She stood up, gave me her firm little hand to shake, and disappeared into the pavilion.

The Crash.

Commonsense, of course, but no end of a facer for me. I hadn't the heart to look for a game since she wouldn't play with me. I put my clubs back in the rack, got out my bicycle, and pedalled ruefully homewards.

I was rudely shaken out of my dreams at the sharp right-hand corner near Amberton church by a fool of a motor cyclist. Evidently a stranger, riding something with a sharp, crackly exhaust, he came round at a cool 45, with his wheels skidding and his brakes shrieking. Why he didn't come clean off, I can't think. He did a terrific wobble, which slewed him across the road, and I thought he was going to ram my old Humber amidships. But he recovered himself most adroitly, wrenched his 'bus over to his own side just in time, grinned at me, and tore on, glancing back over his shoulder. A second later I heard another roar approaching—a sidecar outfit thundered into view round the angle of the churchyard wall, and incontinently upset into the ditch on the other side. Before I could catch my breath three or four more racing motor cycles pelted round the bend in a clump. One of them crashed, and the others by some miracle dodged through the gap between me and the overturned sidecar on the edge of the ditch.

Taking Risks.—

I dismounted and rushed towards the ditch, whilst the motor cyclists returned looking very anxious. The sidecar was upside down on the top of its two occupants, and I was tugging at it ineffectually till the other riders came up, when we soon righted it. In the ditch lay two still, crumpled figures. We lifted them out carefully, and laid them on their backs by the roadside, and the motor cyclist who had passed first knelt by them anxiously.

"Jack's winded, I think," he said presently, looking up at the others, "but Percy's worse. Concussion, I fancy. His bones seem right enough. That's the devil of a blind corner. All up with to-morrow's hill-climb anyhow. Here you, sir (addressing me), is there a doc. or a hospital anywhere handy?"

The Competition Machine.

I told them that Dr. Johson lived a few hundred yards away up the village, and they examined the sidecar, which seemed to be undamaged, for the bodies of its occupants had acted as buffers in the crash.

"Some of you stay here with Jack," said the fellow, whom the others addressed as Utley. "He'll come round in a minute or so for certain. His 'bus seems all right. We'll put Percy in it, and take him to the surgery. Take care of my 'bus till I come back. I suppose I'll have to compete to-morrow just the same."

"I'll drive the sidecar," I put in eagerly, "I'm quite a good driver, and then you can come along to the doctor on your own machine with me."

"She's a hotstuff 'bus, you know?" Utley remarked doubtfully. I glanced at it—8 h.p., o.h.v., open exhaust, with a cigar-shaped racing sidecar.

"That's all right," I rejoined. "I drive everything I can borrow or steal, and never crashed yet."

"Very well, then," consented Utley; "but easy on the throttle, you know. She does 70 as soon as look at you if you give her any gas."

We took Percy to the doctor, but I'm afraid my thoughts were rather distracted from the limp, pallid figure in the sidecar by the extraordinary ferocity of the engine beneath me. Like Utley's mount it was a Blizzard—all the others, I noticed, were riding Whirlwinds. Everybody knows what the Blizzards do at Brooklands and in hill-climbs; but I'm pretty well tied to my desk at the bank, and I'd never actually seen one of their special competition 'buses before. It felt as if it had about ten ordinary engines concealed somewhere about it, and I daren't open the throttle more than a millimetre with that inanimate body in the sidecar. Utley, of course, must be *the* Utley, and "Percy," I supposed, is the Percy Richards who won last year's T.T.

Fortunately, the doctor didn't seem at all rattled about Percy. "Slight concussion," he said. A few days in bed, and he'd be as right as rain. The hospitable medico made him comfortable in a spare bedroom, and told us to look in later that evening.

An Idea.

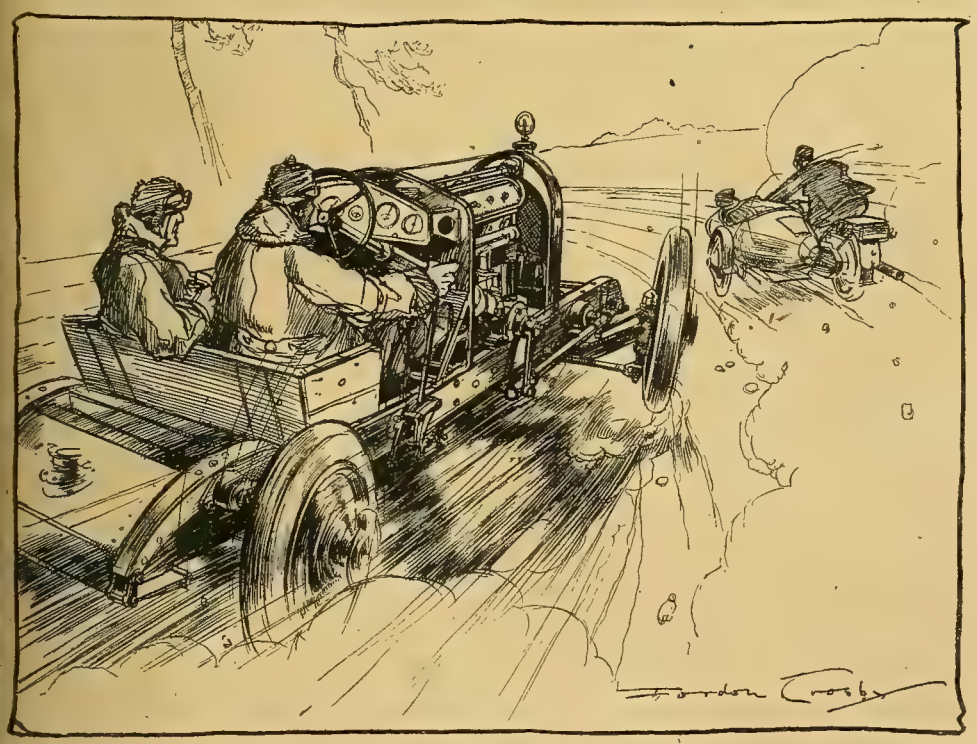
Utley asked me if I'd drive the sidecar to the railway station with him, as the doctor showed us out.

"This is a pretty business," he explained confidentially. "Percy's sidecar and my solo are both very hot stuff. We meant to sweep the board at the Clayshire Club's hill-climb to-morrow afternoon, and were coming up early to have a sniff at the hill. But the fact is Percy's getting too old for his job. His nerve's going, and he knows it; has to fill himself up with whisky nowadays before he does any stunt. We were fools to rip along like that, but the Whirlwind boys started it, and we weren't going to give them best. Percy's going on the management side next year, and we shall want another trial rider. The job is to find one; you see, you want a man with the devil's own nerve, and he must be a crack engine tuner as well."

Then suddenly—

"The directors will be very upset at getting no ad. after spending hundreds on getting that new 8 h.p. dead in the pink. I funk racing round corners on sidecars, but they'll expect me to try. Look here, will you drive her up to Clayshire for me, and then I may be able to save the situation? She's bound to be faster than any other passenger entry, and I daresay I needn't drive her too blue to win."

Ideas had occurred to me while Utley was talk-



". . . the car eased a bit for a corner which its driver didn't know . . . and I cleared him."

Taking Risks.—

ing. Hadn't Dolly said she was an outdoor girl? Wasn't Percy going on the management side next year? Didn't the Blizzard Co. want a new competition rider?

"No, I won't," I said slowly, "but I'm game to do better than that if you agree. The Clayshire climb is up Jacob's Ladder, isn't it? I know that hill blindfold. Our local nuts do all their tuning there. I'll take the 'bus up if you'll agree to my riding her in her classes to-morrow. One thing more. If I do decently with her, you'll recommend me to the directors for Richards's job."

Utley gasped and stared at me.

"You'll excuse me," he said slowly, "but every youngster fancies himself as a racing motor cyclist, and thinks that winning a T.T. is as easy as falling off a log."

"I don't," I said tersely; "but I do know that I can give any of our local boys points at riding or tuning, and there happens to be a good reason why I'd break my neck to get a better job with some prospects in front of it."

We had reached the doctor's gate by now. Utley looked me over appraisingly.

"I won't promise offhand," he said finally. "Tell you what. Ride the 'bus up with me, and if you shape well on the hill to-morrow morning, I'll give you a show. Can't say more than that. We can 'phone the doctor to make sure Percy is all right, and Jack will keep an eye on him, too."

The Test.

I dived into my digs to get a coat and a razor, and in ten minutes we were off. I think my earnestness had impressed Utley, for he rode just behind me, and put me to one or two tests. Somewhere about Featherbridge a new Bentley three-litre out on test hooted its way past us at sixty. Utley rode up level.

"We're not going to stand that!" he bellowed, and down went his nose on the steering head. An 8 h.p. sidecar isn't exactly the mount one would choose for a big scrap on a none too straight road, but I guessed my driving was under special observation. Utley intended to watch me, and didn't let his single right out. I caught and passed him. Then I went after the enormous dustcloud, which hinted that the Bentley wasn't clean off the landscape yet. I didn't at all like diving into that dustcloud, but I chanced it. There were some awful seconds whilst the Bentley and I were neck and neck, wreathed in smoke and grit and flying stones and a thunderous roar. Then the car eased a bit for a corner which its driver presumably didn't know. I *did* know it, and I cleared him. It was here I made good. It was just six miles to Clayborough, and Utley never sighted me again till I slowed a bit for the tramlines. When we pulled up outside the Golden Lion, he condescended to say,

"Youngster, I begin to hope you may do."

* * * * * * * * *

Next morning we breakfasted early and lightly, so as to get out on the hill before the rest of the boys were about. We had the hill to ourselves, and as I stared up at its rutty corkscrew disappearing into the larchwoods, I realised that it was one thing to scorch up it on a standard solo 'bus, and another to put a fire-eating Brooklands sidecar at it. Still, I'd burnt my boats. Old Porteous, our manager, had never loved me overwell, and when he discovered why my desk was empty this morning, the bank would need me no more. Utley and I left our machines at the bottom and walked up. He had an eye like a hawk for ruts and cambers and bits of loose stuff, which might get looser still after twenty or thirty men had been up. Then we walked down, and he got in the sidecar for me to make my first climb.

Sweeping the Board.

To say I was scared is to put it mildly. Utley knew the last words in sidecar racing. Once or twice his body was extended horizontally like a poker to keep the wheel down, with his toes hitched under the carrier or something—I had my hands too full holding the brute to watch him, but I felt the wheel keep down when by all the laws of nature it should have swung up over my head. We simply screamed up, and it took me half a mile to stop her when we were over the top.

Utley drew a long breath.

"Young man," he said solemnly, "consider yourself engaged. What's more if you're half as hot on a solo as you are on a sidecar, I don't mind how soon you succeed to my job as well after a climb like that."

I lost heart a bit during the morning, as one workmanlike 'bus after another roared out from Clayborough, and some of them simply ripped up the ascent. Utley introduced me to lots of famous riders, whom I had previously known only through the columns of *The Motor Cycle*. The nonchalance of these veterans put the wind up me no end, for I was palpitating with fear and hope. But Utley was frankly contemptuous.

"Absolutely nothing to touch you," he decided; "and I can lick anything of my own c.c."

So it proved. I had to drive in five classes. My first climb was a bit scratchy, but the gorgeous Blizzard engine wasn't pressed to fifths of seconds. I was fastest by a bit—not much but enough. When I came down, I noticed the boys at the foot of the hill surveyed me with a new respect, and I knew I'd had my full share of cheering on the way up. In the next class I drove like a demon; and by the time I got to the last class, I was literally inspired beyond all fear. Five firsts, with Utley's seven in the solo classes! Good enough, eh?

Utley pressed me to stay and dine at the Golden Lion with the boys and officials. I knew a trick worth two of that, and made him see that I meant driving the 'bus back to Amberton, where he must pick me up next morning *en route* to the factory. He was evidently disappointed, but said I'd earned the right to my own way.

"By the way," I said negligently, as we shook hands, "what's my screw to be?"

"You're worth a lot," he answered; "but they won't offer you more than £350 to start with. The prospects are first-rate, and there are pickings—bonuses, and the like. Richards made £1,200 the year he won the T.T. and you're young."

The Blizzard felt as if she had 6in. tyres all the way home. I went straight round to the Hall. The maid showed me into the drawing room. Dolly was half buried in a big armchair—dreaming of something sad, I fancy, for she had no book, and her lovely eyes looked clouded. They were radiant when we said good-night.

B.H.D.

Progress of the Motor Cycle in Belgium.

Impressions of the Brussels Show. Belgium Rapidly Reconstructing. The Need for Good Roads. Rival Organisations Controlling the Sport.

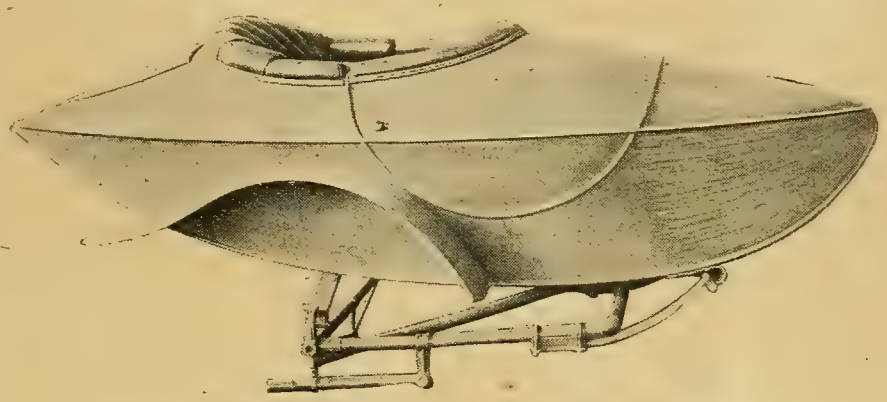
ONE of the most gratifying features of the Brussels Show was the fact that the motor cycle was very much to the fore. This is as it should be in a motor show; and the fact that the motor cycles were shown in an annexe of the same building as the cars was also clearly of benefit to the industry, as it gave the man who was interested chiefly in cars an opportunity of seeing the motor cycles, which would not have been the case had the motor cycle show been held in a separate building or at a different time.

There was really quite a number of motor cycle exhibits, and it was extremely gratifying to note the number of British machines. Naturally, in our report of the Show in last week's issue, British machines were not described, since every one of them had been dealt with in the Olympia Show number; but the fact remains that most well-known makes were represented, and this goes to show that not only are British motor cycles appreciated in Belgium, but that British manufacturers have confidence in the Belgian market.

As the only Continental Show of importance held this year, it is rather surprising that Continental manufacturers did not take greater advantage of it. It was disappointing to see that the famous firm of Peugeot exhibited pedal cycles only; that the Alcyon was not there; that the Viratelle, one of the most original French makes, was absent; and that not a single Italian machine was to be seen in the Exhibition.

The few Belgian machines, which we dealt with at length in the last issue, show distinct originality, considerable promise, and excellent finish.

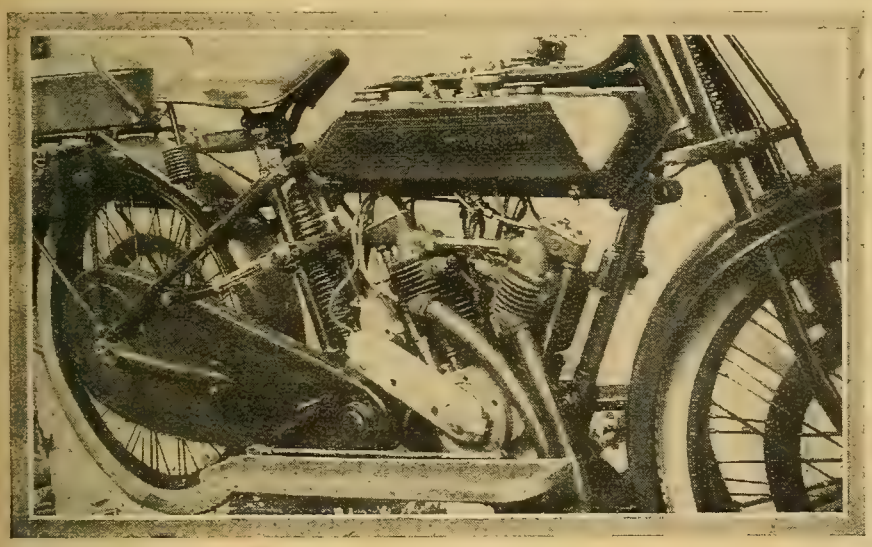
To revert to the Belgian market for British-made motor cycles, the prospect is good on the whole, though this little country, like every other, is suffering from shortage of money. There is, however, no doubt that money has been made by quite a number of people over there, and, though the country suffered more than any other, it is making the most rapid recovery of any embroiled in the recent war.



A distinctive Continental sidecar—the Bleriot, with door on the right side

The Regeneration of Belgium.

In the capital it is hard to realise that comparatively recently it was entirely in the hands of the enemy, but, thanks to the energy of the population, its industry, and capability for pulling together, such a recovery has been effected as has never been recorded in the world's history. As an example, men were at work repairing the floor of the restaurant in our hotel at 4 a.m., which, though not pleasant for the occupants, at least served to mark the energy universally displayed to restore the country to its former prosperity. With these indications it is only natural to prophesy that there is a good time in store for Belgium in the near future, and that trade between Belgium and England will rapidly increase. The little kingdom has the greatest admiration for Great Britain, and will never forget the latter's help and hospitality to her refugees in the dark days of 1914.

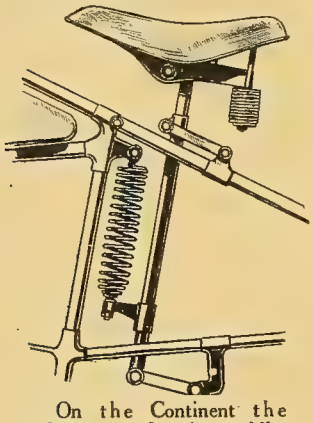


Switzerland's representative at the Brussels Show—the Motosacoche, which has an Enfield-type gear with three speeds

Good Roads Needed.

To encourage and foster the growth of a successful movement one thing is needed and needed badly, and that is a good road system. Unfortunately, railways and trams have been, if any-

Progress of the Motor Cycle in Belgium.—

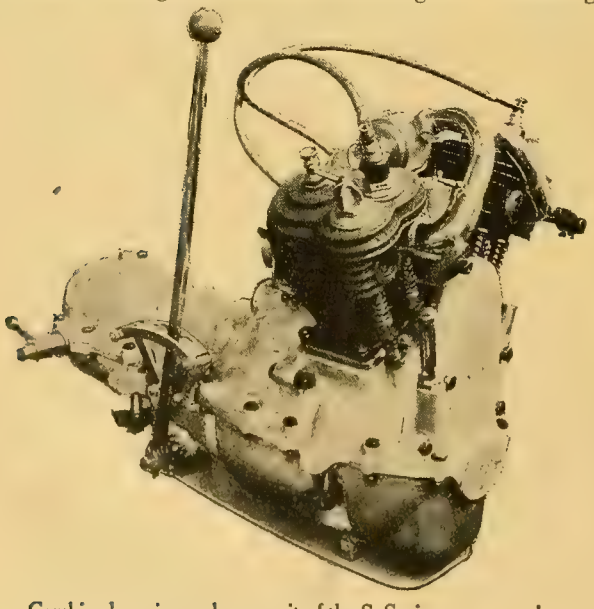


On the Continent the advantages of spring saddle-pillars are now appreciated. This is the system employed by the M.A.G. firm on the new Motosacoche.

thing, overdeveloped, and the roads have been neglected as a means of communication. There is far too much *pavé*, and sufficient attention is not paid to the reconstruction of the great highways, so that they possess durable surfaces capable of withstanding the wear and tear of modern motor traffic. On the other hand, reconstruction of the roads has not been entirely neglected, though much remains to be done. Our Belgian friends should remember that the splendid English road surfaces have done more than anything else to encourage the rapid development of the British motor cycle industry, and it is solely due to these good roads that British motor cycles have reached a higher standard than those of any other country.

Motor Cycle Organisations in Belgium.

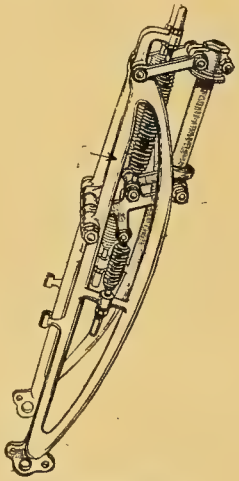
Though among the earliest nations to take up the motor cycle, the general organisation of the sport is more or less in its infancy, and at present the organisers are undergoing a somewhat severe trial. The interests of motor cyclists are looked after by the Federation Motocycliste Belge, a body which, like the Auto-Cycle Union, has had the power of control delegated to it by the chief automobile club—in this case the Belgian Royal Automobile Club. Though it suffers from inexperience, it is doing its best, and, not being too proud to learn, is endeavouring to form its organisation on the lines of that of the Auto-Cycle Union. During our visit we had a long and interesting conversation with M. M. Fagard (president of the F.M.B.), M. Marcellis (a member of the R.A.C.B. and chairman of the Competitions Committee of the Liège Motor Cycle Club), M. Mathot (a member of the Competitions Committee of the same club), and M. Colignon (general secretary of the Belgian Motor Cyclists' Federation).



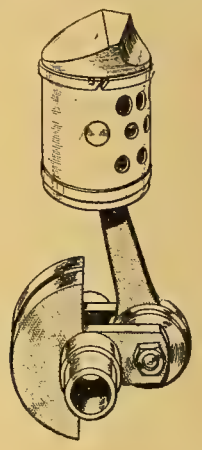
Combined engine and gear unit of the S Spring motor cycle at the Brussels Show.

Interpretation of F.I.C.M. Rules.

Motor cyclists in Belgium are apparently split up into two camps: those adhering to the F.M.B. and those who sympathise with the Union Vélocipédique Belge—the body which looked after the pastime previous to the founding of the F.M.B. At the end of our lengthy conversation between the gentlemen mentioned and one of the "lost sheep" of the U.V.B., we were left with the impression that it appears a good deal of the trouble existing between these bodies was due to the failure of the F.M.B. to interpret the F.I.C.M. competition rules as they stand at present with any idea of generosity. No provision is made in these rules for the inclusion of motor cycles with engines exceeding 1,000 c.c., and one or two machines coming under this category and hailing from the United States are represented in Belgium by young and enthusiastic motor cyclists. Being, therefore, excluded by the F.M.B. from all competitions, they have allied themselves to the pedal cycle organisers—a procedure which would be quite impossible in this country.



Spring forks of the S Spring machine.



The connecting-rod, crankshaft and drilled piston of the Gillet two-stroke.

However, there seems little doubt that Belgium will reorganise her affairs to the satisfaction of all concerned, and that on the occasion of the next F.I.C.M. meeting in Brussels, on January 20th, 1921, the British Auto-Cycle Union delegates will be able, after a quiet talk to explain quite a number of points about which their Belgian *confrères* are not clear.

So far as Belgian competitions for 1921 are concerned, the most popular of the events run in that country—the Paris-Liege-Paris trial—will, of course, be held, while a Grand Prix race will be held on September 2nd over a sporting course in the neighbourhood of Spa. This will be a car event, but it will be either preceded or followed by a motor cycle race, which will be run on T.T. lines.

THE NEW REGISTRATION BOOKS.

Each Motor Cycle is to have a "Dossier" which is not to be Kept on the Machine.

THE time approaches when the whole system of taxation on, and registration of, motor cycles will be changed. We have already given particulars of the new licence card holders, which have to be carried in such a position that they can be seen by a policeman from the near or left side of the machine.

In addition to having to purchase and parade this compulsory accessory, motor cyclists will have a registration book consisting of a manilla board folder making eight pages.

Four of these pages are shown in the reproduction on this page, from which it will be seen that three changes of ownership, after the initial purchase, are provided for on pages 3 and 4. Page 6 will contain full particulars of the machine, date of registration, etc., and page 7 is reserved for a seven years record of licences issued.

The following are the instructions contained on pages 1 and 5:

LICENCE REGISTRATION BOOK FOR MOTOR CYCLE, ETC.

1. The owner must sign under the name and address on page 3 (or 4) as soon as he gets this book.
2. Keep this book in a safe place—not on the vehicle. If you lose the book, you may have trouble and delay in renewing the licence or in selling the vehicle; and you should report the loss at once to the Registration Authority, whose address is on page 2.
3. If the particulars on page 6 are not correct, inform the Registration Authority at once.
4. Whenever the vehicle is on the road, the licence must be carried in the approved pattern holder in the prescribed position, *i.e.*, "in a conspicuous position visible at all times by daylight from the near side of the vehicle."
5. A police officer or an officer of the Registration Authority may at any reasonable time ask you, at your address, to show him this registration book, and he may take extracts from it.
6. If you change the unladen weight of your vehicle or its class (*e.g.*, to goods) or (if not already so licensed) desire to draw a sidecar or trailer, you must at once inform your Registration Authority and send this book to them. (It is an offence not to notify any change of the registration particulars.) If the alteration made increases the amount of licence duty payable, you should send a cheque for the amount of the additional duty.

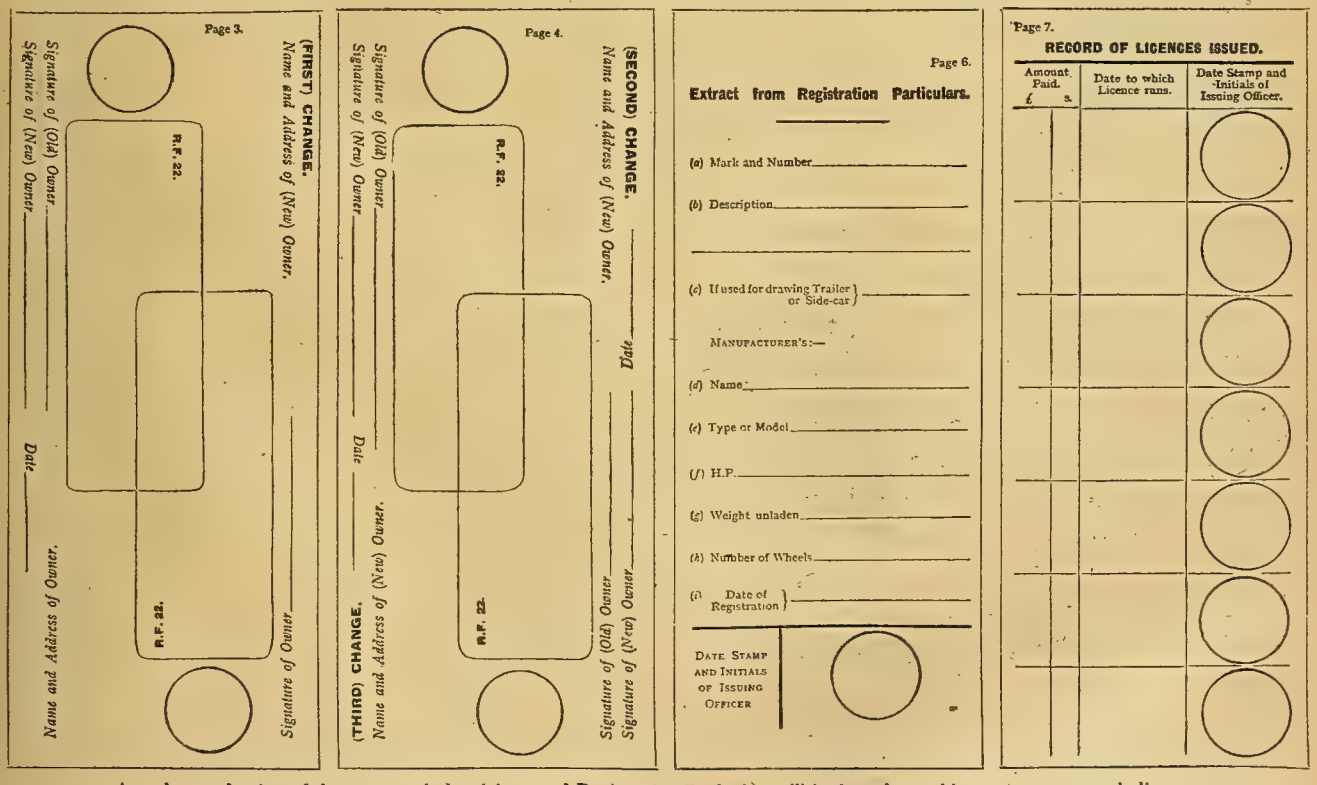
[PAGE 5.]

7. If you change your permanent address, at once put your name and new address in block capitals in the "Change" space on page 3 (or 4, if 3 is filled), sign your name below it, and post the book to your Registration Authority. (It is an offence not to notify change of permanent address.)
8. If you sell the vehicle, you must put the new owner's name and address in block capitals in the "Change" space on page 3 (or 4 if 3 is filled), sign your name below it, and post the book to your Registration Authority. (It is an offence if you do not notify the sale.) The new owner must also send a written notice to the Registration Authority of his district that he has bought a vehicle, and give its index mark and registration number. When the licence expires, the new owner must furnish full particulars of the vehicle on Form R.F.1 on making application for a new licence.
9. When your licence expires, if there has been no change of ownership of the vehicle, get a Renewal Form (R.F.1a) from your Registration Authority or from a Money Order Post Office, fill it up, and either:
   (1) Send it to the Registration Authority, or
   (2) Take to a Principal Post Office in your district:
      (*a*) The completed Form R.F.1a,
      (*b*) The old licence,
      (*c*) This book,
      (*d*) The proper duty,

   and you will get this book back, with a new licence.
10. If you do not wish to renew the old licence, it must be surrendered within fourteen days after the date of its expiry to your Registration Authority. (It is an offence if you do not surrender it within the time stated.) You cannot get a renewal of your licence at a Post Office after the expiry of the time stated.
11. If the licence is not renewed (and is consequently surrendered) owing to the non-use of the vehicle, you must retain this Registration Authority when you apply at a subsequent date for another licence for the same vehicle. When a vehicle is broken up, the registration book must be surrendered to your Registration Authority.

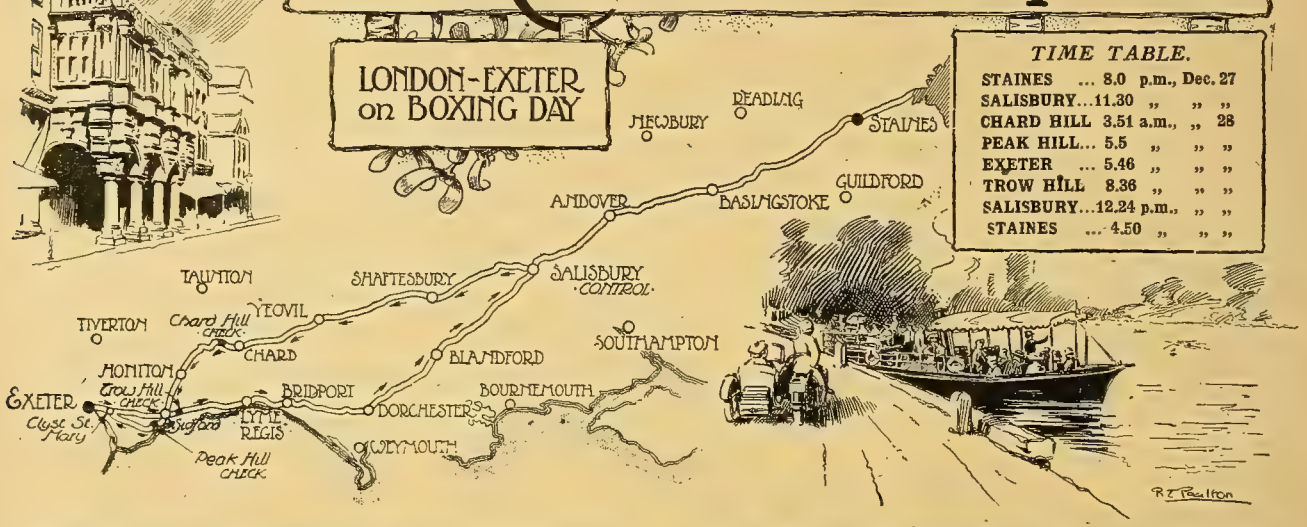
Pages 2 and 8 are left blank and intended for use by the Registration Authority only.

The Auto Cycle Union has issued a shilling guide on the subject of taxation and registration, but we understand that this has not met with the approval of the various authorities, as, in some districts, it has not yet been definitely decided which particular local department will handle the matter. For example, the Town Clerk's Department is given as the Registration Authority for Coventry, but the matter will be handled by the police. In other cities similar confusion is likely to occur, as in some cases the police, in others the town clerk's office or the city treasury department, will take charge of the registration.



Actual reproduction of four pages of the eight-paged Registration Book that will be issued on taking out a motor cycle licence

The Christmas Trial.



TIME TABLE.

STAINES	8.0 p.m.,	Dec. 27
SALISBURY	11.30 „	„ „
CHARD HILL	3.51 a.m.,	„ 28
PEAK HILL	5.5 „	„ „
EXETER	5.46 „	„ „
TROW HILL	8.36 „	„ „
SALISBURY	12.24 p.m.,	„ „
STAINES	4.50 „	„ „

THE 1920 M.C.C.'s London-Exeter-London Trial, starting on December 27th and 28th, will be run under strict trials conditions, and, whatever the weather is like, it will not be in any sense an irresponsible amble along the southern coast.

A departure from the accepted and familiar outward route has been planned by Mr. B. Alan Hill, the organising secretary, and this involves a *détour* at Honiton to climb a hill of some gradient near Sidmouth. As this will be negotiated in the grim hour before dawn, it may account for more than a few failures.

Those who contend that the sporting side of the motor cycle movement is on the wane have only to look at the list of entries, which is given below, for a negation of the idea. It will be seen that there are eighty solo riders and a similar number of sidecar enthusiasts. In addition to these there are thirteen three-wheelers and sixty-four cars. Of these the palm for enthusiasm must certainly be awarded to the soloists, especially those who are undertaking the long double journey of 318 miles on lightweight machines.

The first pair of competitors start away from the Bridge Hotel, Staines, at 8 p.m. on Monday, December 27th, and thereafter the competitors leave in pairs at one-minute intervals. The arrival of the first pair at Exeter is timed for 5.46 a.m. on Tuesday, and after a short respite the competitors start out again on the homeward journey at 7.50 a.m., being due to finish at Staines at 4.50 p.m. on the same day.

This run is essentially one which is only undertaken by the keenest of riders, since it not only involves riding throughout the whole of one night, but it is usually carried out under the most adverse weather conditions. It is a test of the riders, their machines, lighting equipment, and, above all, of the water-proofness and cold-resisting qualities of motor clothing, since it almost invariably rains when the competitors are crossing such open and exposed stretches of road as that over Salisbury Plain.

For the convenience of spectators along the road, the list of the entries given below is sectionised according to the makes of machines used.

CLUB NEWS.

Barrow and District M.C.

A whist drive and dance will be held in the Co-operative Hall, Abbey Road, Barrow, on Thursday next, the 30th. The whist drive commences at 7.30 p.m.; dancing until 2 a.m. Tickets, 1s. 6d. each, can be had from any member of the committee, or from the hon. secretary, Mr. W. A. Singleton.

Ripon and District M. and M.C.C.

The above club recently held their annual dinner at the Unicorn Hotel, when Mr. E. H. Ingram (vice-president), in the unavoidable absence of the President, presided over a large gathering. In the course of the evening the chairman presented the prizes won during the past year. An excellent musical programme was contributed to by various members and friends.

Kidderminster M.C.C.

Over seventy members and friends attended the first post-war dinner of the Kidderminster Motor Cycling Club, held at the Lion Hotel recently under the chairmanship of Capt. W. H. Stewart-Smith. During the evening the president, Mr. Loughton Goodwin, distributed a large number of prizes won by members in open and club competitions, including the handsome B.S.A. Challenge Cup, open to all England, which was won by Mr. F. W. Giles, of Kidderminster and Wolverhampton.

North-West London M.C.C.

Taking the place of the annual London-Gloucester Christmas run, a short "daylight" reliability trial will be run on January 1st. The start will be made from Jack Straw's Castle, Hampstead, at 9.30 a.m.; and, after a short, circular route through the Chiltern Hills, the finish will also be at Hampstead at 4 p.m. A non-stop run of 15½ miles is included, but tyre trouble in this section is not heavily penalised, provided no other adjustment be made to the machine during such stop.

A prominent scheme in the programme of this club is the motor camping section, which, while by no means a new pastime, is not specially catered for by many other clubs in this country.

The secretary of the North-west London M.C.C. is Mr. H. J. Pooley, 23, Clifton Avenue, N.3.

Keighley M.C.

The Keighley Motor Club recently held its first annual dinner at the Queen's Hotel, about seventy members and friends being present. The medals, etc., for the past season's events were presented by the president, and a very successful evening concluded with a musical programme.

Stourbridge M.C.C.

The above club will hold its annual Boxing Day event, the "Heroes" One Day Reliability Trial, on Monday, December 27th, over a sporting course of approximately one hundred miles. The well known local hills will be included, together with an acceleration test to decide the ties. The lunch stop will be at headquarters. The start is at 10 a.m.

West Kent M.C.

In spite of the "Christmas card" weather, a band of enthusiasts met to decide the club's flexibility test on Saturday, December 11th, with the following results: Under 350 c.c.—Heath (2¾ Douglas). Singles, over 350 c.c.—Gosling (4 Triumph). Twins, over 350 c.c.—Eastwood (8 Zenith). Passenger machines.—Barnes, jun. (6 Martinsyde sc.). The run back to headquarters was in the nature of a "Colonial trip."

Ilkley and District M.C. and L.C.C.

Remarkably good consistency riding was achieved by members of the Ilkley and District M.C. and L.C.C. in their winter trial on December 5th, for the trophy presented by Capt. S. S. English. As each competitor started he was given a card showing the names of the places through which he must pass. He had to find his own way by means of the map and was checked along the route by observers. On the last circuit, which was on a switchback track with a number of rough surfaces, W. Bradley's performance on a 4 h.p. Indian showed the remarkable figures of .01 m.p.h. variation of his standard time. His total error from his first circuit was 2.12 m.p.h. C. L. Peacock, on a 3¾ h.p. Scott and sidecar, was placed second with a total error of 2.175 m.p.h., and Alec Dovenor, also on a 3¾ h.p. Scott and sidecar, was third with a total error of 2.626 m.p.h. There was only one retirement.

Bedford and District M.C.

Not the least successful item on their programme this year was the annual dinner of the Bedford and District M.C., which was held at the Dujon Café on Thursday, the 9th. Over seventy members attended, and the success of the evening was enhanced by the presence of ladies. Many handsome trophies and gold medals were presented to successful competitors in events during the past year; and it was generally agreed that the future of the club was rosy.

Blackpool and Fylde M.C.

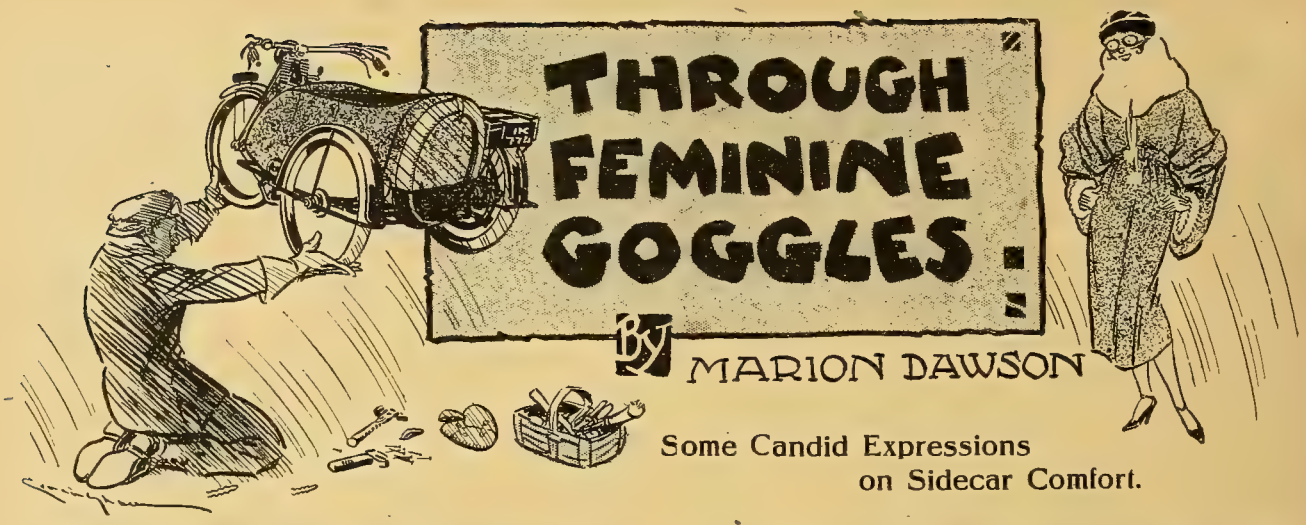
The above club held a very successful hot pot supper and smoking concert on Wednesday, December 1st, at the headquarters, South Shore Hotel, Blackpool. At the general meeting on Monday, December 6th, at headquarters, Mr. Thos. Sharples, chairman of the club, presented the three gold medals won in the reliability trial held on October 17th, 1920: Sidecar class, W. Lyons (7-9 Harley-Davidson, sc.); solo class, M. Parkinson (3¾ Scott). On Boxing Day, December 27th, the club will hold its Christmas Reliability Trial over a 100 mile course.

Worcester and District M.C.C.

At the Masonic Hall, Worcester, on Thursday, 9th December, the first annual dinner of the above club was held under the presidency of Mr. R. W. Barker. In addition to praising the work of the secretary, Mr. Howell, and the various other officials, many interesting references were made to the past and future work of the club. They had many ambitious ideas, including, on the social side, the renting of a building as a club house, and on the sporting side a suggested T.T. race round the Malvern Hills. Mr. Alec Ross said that he appreciated the way in which the club had lived up to its title of "the sporting club."

Mr. E. W. Thomas proposed the health of their Chairman, who, he said, helped the club not only with his name, but also with his purse.

The Chairman, in replying, tendered his thanks to Messrs. E. Davies and Blandford and Mrs. Gibbs for having contributed musical items during the evening, and also to their treasurer, Mr. B. Parkes, who acted as accompanist.



THROUGH FEMININE GOGGLES.

By MARION DAWSON

Some Candid Expressions on Sidecar Comfort.

I WONDER how many sidecar designers have sought a woman's views on what constitutes comfort in sidecar design? Not all, I imagine, judging by results, despite the fact that sidecars are almost exclusively used for the conveyance of the weaker sex. Having had some little experience I would like to give my views on the defects and possible improvements in the design of the sidecar vehicle.

Springing seems to me to be the essential factor in the matter of comfort. Without adequate springing a sidecar journey of any length is not only uncomfortable, but the effect on one's nerves is positively harmful, dreams haunted by phantom pot-holes and stones of enormous size being a not infrequent result of a day's run in a badly sprung vehicle. Some sidecars, too, are not built deep enough, and with unsuitable springing the risk of being thrown out justifies the feeling of fear experienced when the wheels of the vehicle meet with obstruction, or when one of the all too numerous stretches of bad road surface is traversed.

Worshipping at Two Shrines.

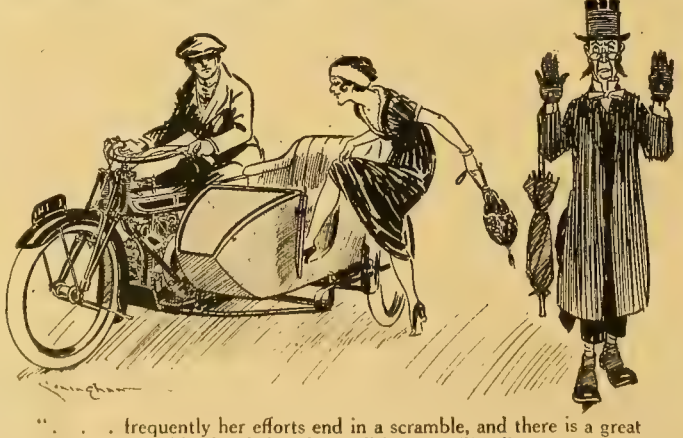
Reference might be made to the varying widths of sidecars, for some are certainly not built wide enough for comfort. (No, I am not blessed with too much *embonpoint*, turning the scale at a little under eight stone, but I have more than once felt the need of a gadget of the shoe horn persuasion to get into such a sidecar.) "Economised on size," says my escort, "to give the 'bus a better chance—we shall fly up the hills on top." We do, but I am hardly able to move during the run, and need help to get my cramped limbs out of the "feather-weight" at the end of the journey.

Some sidecars possessing many attractive features have a distressing habit of creating neckache. This, I have discovered, is due to the slope of the back of the vehicle. Unless the sidecar body is deep enough for support to be given to the shoulders, the back panel should be at right-angles to the seat, for it is far more comfortable to sit upright, as in a Windsor chair, than to be in a half reclining position with a badly aching neck.

Sidecars without seats, but fitted up instead with a long floor cushion, are a different proposition, but even these luxurious conveyances have their failings. Often they are not quite long enough, and to have one's knees doubled up is as annoying as the knowledge that one's shoe toes are being crushed against the end of the sidecar body.

Pride and Practicability.

The exhibition of a woman getting into a sidecar is often anything but an attractive sight. Frequently her efforts end in a scramble, and there is a great likelihood that they will be unavailing—without assistance—if she is wearing a fashionable skirt of 1920 Anno Domini. Some sidecars have no door at all, while others have a door about the size of a small pocket handkerchief let into the top of the side panel. To enable a lady passenger to get into a sidecar easily and gracefully, the door should be wide enough, and the opening low enough to enable her to step up comfortably from the ground, or as an alternative a conveniently placed step should be provided.

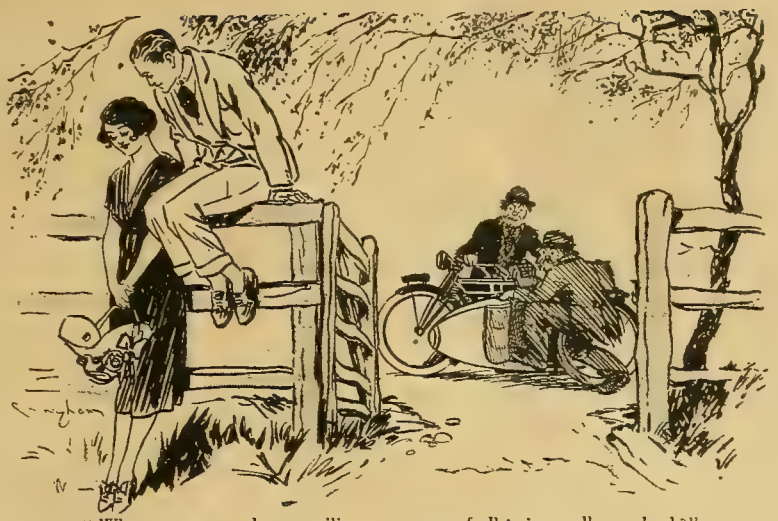


". . . frequently her efforts end in a scramble, and there is a great likelihood that they will be unavailing."

The variety of methods of fastening a sidecar door is a matter of wonder to my unmechanical mind. A satisfactory and decidedly simple means of holding the door in place is a button on the inside of the door itself, and is infinitely preferable, from the passenger's point of view, to a fastener which refuses to function if the door is slightly warped, or perhaps jolted a little out of position. I write feelingly, having recently

ridden some miles holding a sidecar door in place when an obstinate catch refused to work.

In conclusion, I would ask any sidecar maker to solicit the help of a lady of his acquaintance before designing his next model. I suggest that he should take her for a run on a trial model, impressing on her before the start that her *candid* admission of any discomfort experienced is required, and inviting her suggestions as to any possible improvement in his design. The italics are mine, for one finds it is seldom a wise, and often a futile, policy to grumble when the occupant of the saddle asks after one's comfort. New sidecars do not grow on blackberry bushes, and where the "best boy" is concerned the temptation is to suffer silently, for in grumbling a considerable risk is taken of further delightful spins over the roads and lanes of our charming countryside being curtailed, or even indefinitely postponed, whereas who can say to what a smiling assurance of all being well may lead?

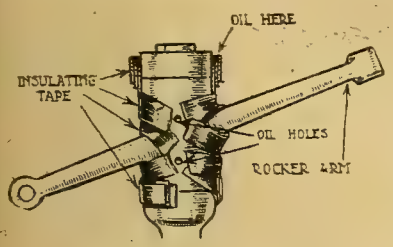


"Who can say to what a smiling assurance of all being well may lead?"

Care of Overhead Valve Mechanism.

A Few Hints for Reducing Wear and the Amount of Attention Required.

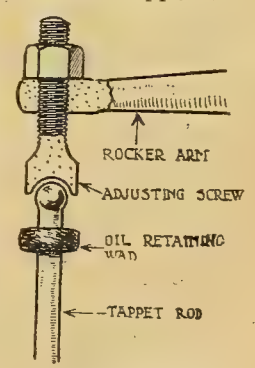
AS everyone knows who has ever possessed an engine having both valves overhead, it is necessary to give the valve operating mechanism a certain amount of attention. This, however, is amply repaid by obtaining a higher degree of silence, durability of the various parts, and general efficiency. If a few simple measures are carried into effect the necessary attention can be reduced and the mechanism can be made to wear better.



The rocker joints of an overhead valve mechanism wrapped with insulating tape to prevent grit wearing the working parts.

It is the custom to keep the working parts well lubricated with engine oil, which, unfortunately, causes the friction faces to collect grit, this being the chief cause of wear; and at one time I used regularly to take the whole machinery to bits, wash each part in paraffin, and put it together with clean grease—a troublesome, but thorough, business. I have now taken to wrapping the rocker joints with insulating tape in such a way that the joint is overlapped, so that the tape not only serves to exclude foreign matter, but acts as an absorbent wad. The joint can be completely bound so that the tape sticks to both members, since their movement will speedily release one side, thus leaving the rocker arm free to move. If the tape can be so arranged on the top side as to form a slightly recessed cup, as it can in the case of the A.B.C., so much the better, as a drop of oil introduced into the cup is retained long enough to soak into the joint, instead of being distributed broadcast.

In the case of the A.B.C. and a few other engines, the end of the push rod comes in contact with the end of the adjustment screw—a point at which a good deal of wear takes place and some noise naturally occurs. At one time I used to make a point of keeping these two contact faces as clear of oil as possible, as I found that the lubricant caused the adjustment screws to work loose. One day, however, I washed the whole mechanism with petrol, then put the adjustment screws back with a little Summit jointing material smeared on the threads—which, by the way, I have found most useful stuff—and this proved a safe remedy against the loosening of the screws. It also rendered it possible to keep the tappet rod ball joint permanently lubricated. Take the tapped rod out, and bind it near the end which comes in contact with the screw with some kind of absorbent twine, such as thin silk tape, and so as to form a wad. This wad can then be kept soaked with oil, which oozes on to the traversing surfaces and prevents clattering.



Overhead valve adjustment screw and the improvised oil-retaining wad.

I think that anyone who cares to carry these tips into effect will find that their overhead valve mechanism can be more or less left to look after itself, and will give much better service as regards wear and reliability. I may add that, in my opinion, half the alleged shortcomings of overhead valves are due to a lack of intelligent interest on the part of those who own them, and personally I much prefer this type to the side-by-side variety.

CHINOOK.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

STRING FOR CHAIN REPAIRS.

Sir,—It would be interesting to know if any of your readers have managed to get out of such an apparently hopeless position by such simple means as I recently employed when following hounds on my 1912 2¾ h.p. Douglas. The chain broke, and, although I had a spare link, I could not find the spring to keep it together. The only thing I had in my pocket was a piece of thin string, and, as a forlorn hope, I decided to use it. I tied it crosswise round the link, and, to my surprise, reached home without further trouble, thus avoiding pushing my machine for eight miles.

R. HOPE.

A LICENCE CARRIER POINT.

Sir,—In reading "Further Details of New Licences" in your issue of December 9th, it struck me that the "off" rather than the "near" side was the better place to carry the new motor licence card which is about to be thrust upon us. First, because, when carried on the near side, it limits the card to the front forks or handle-bar in the dual-purpose mount, unless the rider is willing to shift his licence every time he attaches a sidecar. Secondly, motorists are alive to the fact that most of the police we pass are point duty men, who are only able to see the "off" side of our machines. This is obvious, and needs no further comment.

Perhaps the authorities have a good reason for their action; if so I should very much like to hear it.

R. A. McLAREN.

Sir,—With regard to the new taxes there are these points which will need to be watched for sidecar outfits.

(1.) The registration receipt for the sidecar will need to be separate from that for the motor cycle, as many of us keep the sidecar when selling the machine.

(2.) Motors are used both with and without sidecars. Will the card have to be carried on the sidecar when together and on the motor when solo, or can it be carried on the motor always? What a glorious victory it was!

EDGAR CARR.

THE SHOW AND THE SCHOOLBOY.

Sir,—I am a public schoolboy, and have been an interested reader of *The Motor Cycle* since I was given a 3½ h.p. Rudge nine months ago. Could it not be arranged for the Motor Cycle Show to be held in early January, or at some time when public schoolboys could visit it? Day by day more and more boys are becoming ardent motor cyclists, and it is a difficult task to make a choice from one or two motor cycles seen in a country agent's window. In a school as far North as this (Cumberland), there are about forty of us who live in London, and many of us own motor cycles. One or two of us hope even to follow in the footsteps of R. O. Clark, H. Le Vack, Watson-Bourne, and other premier motor cyclists of the day.

A. S. GRAY SCOTT.

ROAD REPAIRS AND NIGHT RIDING.

Sir,—Recently I was bringing a sidecar from Newcastle southwards, and, owing to a slight fog, we were hugging the side of the road. On the Newcastle side of Birtley we knew that the road was under repair, and, consequently, kept our eyes open for the usual corporation danger lamps. They appeared, and we intended approaching to within twenty yards before switching on to the off side. However, suddenly we crashed into some huge heaps of road metal, merely tipped on the road, at least twenty-five yards from the first lamp. I swerved quickly and tried to avoid the foremost heap but came near a frightful spill, my passenger being thrown violently, nearly leaving the car.

After ascertaining possible damage, I examined the heaps, and found them to be first a load of earth, then two loads of large sized metal. We got over the first one, but would rather not contemplate the possible consequences if we had struck the metal heaps first, these being about 3ft. or 4ft. high. Needless to say, my passenger is suffering from shock as a result of the accident. Luckily, as far as I can ascertain, the machine is undamaged, except for a broken sidecar mudguard.

EX-D.R.

Wolsingham.

WHAT IS A SILENCER?

Sir,—As an old reader of your valued paper and prospective owner of the machine in question, I am more than interested in the correspondence in your recent issues with reference to the silencing of the 3½ h.p. sporting Norton.

The Sunbeam people also are turning out a machine with a similar exhaust fitting. It certainly seems to be somewhat farcical that a machine in one particular district is fulfilling all legal requirements, but on being run in some other place is not.

Cannot some action be taken to obtain a definite ruling on this point?

E. E. HOWELL.

STRONGER CARRIERS WANTED.

Sir,—Anent "Pillion's" letter in *The Motor Cycle* of the 2nd inst., I have also observed that in the later models of most machines the supports of the carrier are confined to oblique stays longitudinally fixed to the hub of the back wheel, with no support to the saddle.

I knew of a case recently where a rivet sprang, and the whole carrier, together with the stays, fell backwards. Luckily no pillion rider was using the carrier at the time. This happened to a motor engineer of my acquaintance, who thereupon pointed out the danger in my own machine. He has devised neatly fitting stays which now connect the carrier with the saddle tube, the result being a distinct success.

Since that time he has standardised them, and now has quite a demand. If any of your readers are interested in the acquisition of these stays, the name of the firm is Mason and Peacock, Park Avenue, Hull, with which firm I have no connection.

ALAN G. FISHER.

BOILING WATER AND SODA FOR CHAINS.

Sir,—*Re* "Ixion's" remarks on chains, perhaps my method of cleaning them will be of interest. It may sound rather drastic, and some may say that the process will affect the steel, but all I can say is that I have used it dozens of times on both "push" and motor cycles with every success. My present chain on a 4 h.p. Triumph has done well over 7,000 miles without a breakage, and is still going strong.

Put the chain in an old pan, fill up with water and a little soda, and boil, then scrub with a stiff brush, and afterwards boil again. It is surprising the dirt, grit, etc., that is left in the pan and how clean the chain is. The chain should be taken out when the water is still boiling, and the surplus water shaken off; the rest will have all dried up by the time the chain is cold. Now stand in paraffin for a few hours, and then rub in some sort of grease.

I wonder if any reader could give me a tip for making a belt guard for my Triumph. I find splashes of mud all over the engine, etc., if the roads are not dry.

L.K.J.

York.

WILL SOO N BE 1921!

Sir,—I should like to say a few words in regard to the new regulations, or inconveniences for motorists. I wish to protest most strongly and vehemently against the exorbitant, intolerant, and unfair taxation. What have all the motor organisations done or going to do about this matter? They seem to have taken it all lying down. I, for one, am going to sever my connection with the A.C.U. over this business. My fees will help towards the extra tax, if it be inevitable. What has gone wrong with *everybody?* Are we all going to submit tamely and say nothing? Up and at 'em, everybody is affected. Have we not had enough (and more) of control, restrictions, inconveniences, etc.? It is high time it was all wiped off the board.

This registration form-showing business is a relic from Army life.

I have yet to learn that gun licences, livery tax, carriage tax, and also the dog tax have been raised on the same extortionate scale. And why on earth the motorist alone from among all other taxpayers should be the only one compelled to carry a visible form showing the tax has been paid defies all comprehension. It is time we said "Enough," and asserted ourselves.

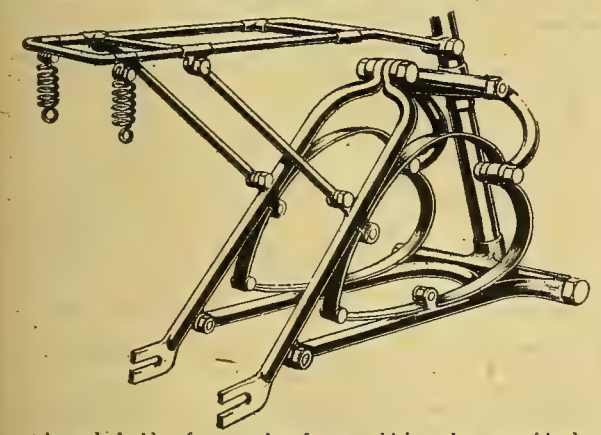
A WORKING MAN WEEK-END MOTORIST.

Leeds.

A READER'S REAR SPRINGING DESIGN.

Sir,—I think there must be some inherent difficulty in designing satisfactory spring frames, as, judging from the reluctance of the manufacturers to adopt them universally, or the reluctance of experienced riders to possess them, one must come to the conclusion that they do not give the satisfaction that was expected of them, or they would have been universally used by now.

I have been trying to think the matter out with a view to obtain a permanent lateral rigidity that will not be over springy and jumpy, and will not have too many pivots to work loose; also to keep a tension on the ones you must have, so that they will not be inclined to rattle and jump loose. For this reason I have avoided the use of links.



A reader's idea for a spring frame, which makes use of both leaf and coil springs. The latter are in compression against the mudguard. (See letter by Mr. W. F. J. Simpson.)

I enclose a sketch which, I think, explains itself, merely drawing attention to the fact that both the chain stays and the back stays may be triangulated slightly, giving additional rigidity.

As the load is taken by four leaf springs they could be made of single leaves, slightly tapering, and my idea was to make them of rustless steel.

The leverage on them would nowhere be very great, so that they need not be fastened with strong heavy chairs—in fact, simple pivot fastenings would give greater resiliency and avoid undue strain.

I do not see that the pivots should wear any worse than the links of the front fork, and simple provision could be made for adjusting them or renewing them if necessary—in fact, all the parts could easily be replaced by the owner of the machine.

As the load is divided between the back stay and the springs, and this again has to be divided by four to get at the load taken by each spring, I do not think the leaves need be very thick, and I fancy they would take an extreme bend without breaking.

I have shown a coil spring (compression) between the carrier and mudguard partly to prevent the carrier from rattling and partly to take any load the carrier might be called upon to resist (and, incidentally, it would relieve the leaf springs).

As I have not the means at hand to make a large scale drawing, it is very difficult to ascertain correctly the driving centre. It seems to vary a great deal with slight modifications of the frame; but this difficulty shows it would be easy to find a centre that would practically give no slack to the belt or chain.

I thought the design looked so promising that I have applied for provisional protection.

WILLIAM F. J. SIMPSON.

THREE-INCH TYRES ON LIGHTWEIGHTS.

Sir,—I noticed in a recent issue of *The Motor Cycle* you raised the point of 26in. × 3in. tyres for lightweight machines, especially selecting the Cleveland as an example.

Having ridden the Cleveland a considerable distance during the present year, I should like to state that it is one of those things that have to be tried to be realised, and if any have doubts as to its being a success or otherwise, I should suggest they try the Cleveland on their pet bit of "pot-holey" tramlines on a greasy December day.

The point may be raised that these tyres slow a machine, or pull down its efficiency, but the results we have had, both solo and with a sidecar fitted, have justified us claiming, or rather backing up, Messrs. Rudge-Whitworth's experiments on Brooklands some time ago. It is interesting to note that immediately after these tests Rudge-Whitworths standardised 650 × 65 mm. tyres on their models.

I made a journey to the Midlands to try and convince one of our prominent lightweight manufacturers that there is a wide market for a *modèle de luxe* lightweight fitted with large tyres and efficient mudguards, especially for doctors and professional men, and beg to suggest in conclusion that my experiments lead me to maintain that tyres of this class make a spring frame absolutely superfluous.

BERT HOULDING,
Director, BERT HOULDING, MARKS, AND CO., LTD.

THE ROADS BILL.

Sir,—On more than one occasion during the debates on the Roads Bill, the Parliamentary Secretary to the Ministry of Transport has stated that the recommendations of the Advisory Committee of the Ministry were unanimous as to the necessity for the proposed registration book as part of the 1921 administrative machinery for the collection of the new motor taxes.

As representing the interests of the Society of Motor Manufacturers and Traders and the Automobile Association on this Committee, it is only right that I should at once explain that from the first I have been strongly opposed to the recommendations of the majority of the Committee in relation to this so-called registration book.

The idea of the book originated, not as Sir Eric Geddes informed the House of Commons, in the Post Office, but in the belief by some of my colleagues on the Committee that it would materially check the traffic in stolen motor vehicles. The machinery of the Post Office in renewing quarterly or annual licences requires nothing more than a surrender of the licence card. The registration book for this purpose is redundant and unnecessary.

With reference to the very laudable desire to check the traffic in stolen vehicles, it is instructive to mention that Sir Eric Geddes refused to re-enact the provision contained in the Motor Car Act, 1903, enabling an unregistered car to be driven to an authority for registration, on the ground that as the new machinery will enable the registration book and the licence card to be obtained through the post, there will be no necessity for the car to be driven to the registration authority at all.

We may be delighted to hear this, but if it be true it is germane to ask what possible check the registration book will provide against the traffic in stolen cars, when that book can readily be obtained by the thief through the post.

It would surely appear that this book as a document of title will tend to aggravate the very disease it is intended to remedy.

ALFRED HACKING,
General Secretary, Motor Legislation Committee.

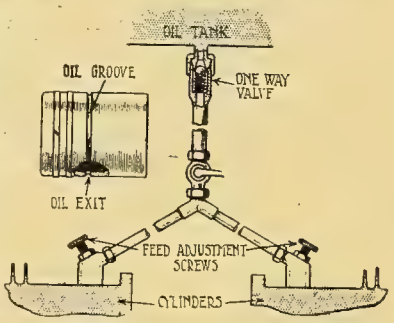
A SILENCING SUGGESTION.

Sir,—I have noticed in your columns several new designs for silencers. Since the greatest difficulty in silencing appears to be back pressure, I would like to suggest that both silencing and engine efficiency would be greatly improved by giving the exhaust valve a greater lift, or in a two-stroke making the exhaust port larger, and casting small, close radiating fins along the length of the exhaust pipe and silencer. By this means the gases would be much more rapidly cooled, and the expansion on entering the silencer would not be nearly so great. R. S. MORGAN.

OILING THE A.B.C.

Sir,—I agree with "Ixion" that Mr. Bradshaw might have arrived at a better system of oiling for his otherwise beautifully designed A.B.C. I have so far mastered the oiling of my machine that it is no longer a source of trouble, but that it is not perfect is proved by the fact that the left cylinder gets a good deal hotter than the right—so much so, indeed, that my right foot is often cold while my left is quite hot!

It would be very convenient to have an adjustable and independent feed to each cylinder, and I append a rough sketch of an arrangement which I am thinking of fitting. The ball valve is simply to cut off the supply when the machine is standing, in case one should forget to turn it off; and the system would be employed, I may add, more for the sake of equalising the oiling than for feeding the entire supply.



A suggested arrangement for the oiling of the A.B.C. engine, whereby equal distribution of oil is maintained.

Though the sketch is self-explanatory, a word of description may prevent error. The feed is maintained by the crank case vacuum, assisted by gravity. The vacuum draws the ball valve off its seating (if the ball valve does not stick!), then through the feed pipes to the respective cylinder walls, each cylinder being provided with an independent adjustment screw. An oil-retaining groove is cut round each piston just below the rings, and, there being but one outlet, and that on the opposite side, namely, the bottom of the piston, this groove is (theoretically) always full of oil.

I wonder if any other experimentalist has tried a similar system. H. MORTIMER BATTEN.

BEATING THE PUNCTURE FIEND.

Sir,—In recent issues three writers reach out a helping hand to the unhappy "Never Again," who, in *The Motor Cycle* last month, told a sad tale of puncture trouble, and who, to get even with the puncture fiend, threatens to go back to solid tyres.

As I have given some study to the puncture problem, and have been free from punctures for fully 30,000 miles, perhaps "Never Again" will be interested in my experience.

In my first 11,000 miles motor cycling I had forty-seven punctures. These were all in the *rear* tyre. The experts told me that that was due to the extra load there. I also noticed that my punctures—

(1.) Were caused by straight nails, incapable of standing on end, unless for a moment.

(2.) Were got when going fast.

(3.) Were got on dry roads, never on wet.

These facts seem to me to show that the front tyre is really the puncture fiend. It puts nails on end to puncture the rear tyre.

I therefore designed and patented a rear tyre guard to keep all nails out of the rear tyre. As I expected, this device has reduced puncture troubles practically to zero. The puncture preventer was a perfect success in a road test over 80,000 nails. (See *The Motor Cycle* of Christmas, 1919.) The nail movement was photographed in one-thousandth of a second, and a lantern slide prepared. When this was shown the whole thing became as plain as a pikestaff.

Mr. C. Tyers (*The Motor Cycle*, November 18th) recommends my puncture preventer "for flat-headed nails, standing point up." He is quite right; but I would remind him that such nails are uncommon on the road. Out of over 6,000 nails collected by me from British roads less than one per cent. were of the "point-up" kind. The deadliest foe is the straight nail, which jumps up for an instant after the passage of the front tyre over it, and finds a billet in the rear tyre. The puncture preventer makes a clean sweep of these.

M. M. MONIE,
M.P. PUNCTURE PREVENTER CO., 38, Bath Street, Glasgow.

EVERYDAY RIDERS' WANTS.

Sir,—"Easily Satisfied" should keep to the point. There are one or two statements to which I take exception:

(1.) "It is easily seen he is not an engineer." What marvellous deduction! I thought I accentuated this in my letter.

(2.) "Commonsense would tell anyone that, from an engineering point of view, ball races are superior," etc.

My preference for plain bushes was for ease in replacing.

(3.) "What better front brake and spring frame than the Beardmore," etc.? The front brake is ideal; but as the makers have to run the risk of chain breakages this is as it should be. Spring frames "cut no ice" with me.

(4.) "What engineer would prefer to turn and fit bronze bushes when ball races can be obtained," etc.?

We don't work because we love it, but because we have to. 'Nuff sed.

However, I am immensely relieved to find that he agrees with me on one point. Spares. *Facit indignatio versum.*

Glasgow, W. FED UP AND DISGUSTED.

UNPUNCTURABLE TYRES.

Sir,—Recently an intelligent boy called my attention to an "unbustable" ball, explaining that even if the outer rubber ball were cut or torn it did not become useless, as the inner ball held the cover in shape. Such inner ball was a core similar to the rubber sponges used for toilet purposes.

Would it not be possible to manufacture an inner tube, the centre to be filled with a core of this rubber sponge? I am assuming that the sponge core could be made of such consistency as to give the deflated tube the appearance and effect of a partly inflated, say half inflated, tube. The difference between the consistency of the core and full inflation to be effected by the usual method of pumping up. Such a tube, gashed, would only partly deflate—*i.e.*, to the extent of the air pressure lost. The cover and tube would then not be so liable to roll off and cause a smash as with the present tube. Further, say on a sidecar wheel, one could ride home on a punctured tube, the core being sufficient to prevent damage. Probably to enable the use of such tubes, one side of the rim would have to be removable as in large car tyre practice, but this should not be a great drawback.

Sheffield. W 8406.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook on the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"MOTOR CYCLE REMINISCENCES." By "Ixion," of *The Motor Cycle.* An interesting and amusing description of early motor cycling experiences, with many unique illustrations	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland. London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20 Tudor Street, London, E.C., or of leading Booksellers and Railway Bookstalls.

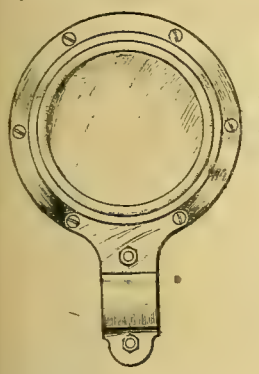
Further Examples of Licence Card Holders.

Over Thirty Firms now offering the New Compulsory Accessories.

IN last week's issue we were able to give particulars and illustrations of the licence card holders of fifteen firms offering them. Amongst the further batch of fifteen which has been submitted to us is a very novel type manufactured by Messrs. Nicol and La Riviere, 4, Emerald Street, London, W.C. A strip of metal is fixed at the bottom of the front plate by two small screws and again at the top with a similar screw. This portion retains the glass and metal holder in position, whilst this latter can be rapidly removed by unscrewing the top screw. It is finished in aluminium or nickel plate, and has a distinctly smart appearance.

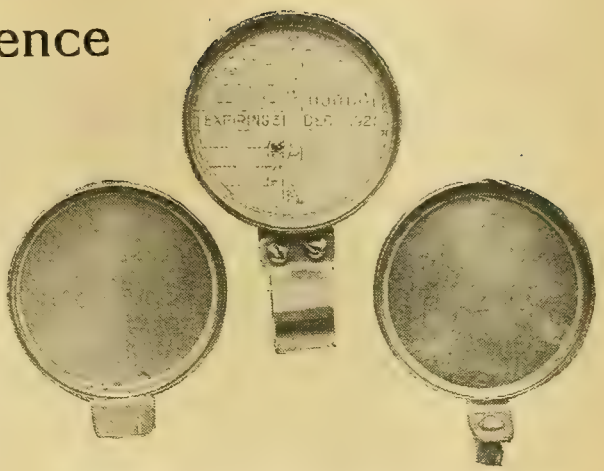
A substantially constructed holder is marketed by Messrs. S. Smith and Sons (M.A.), Ltd., 173, Great Portland Street, London, W.1. The front plate is provided with a milled edge, whilst a boss in the centre of the back plate holds the glass and packing tightly against the front plate. Three screws hold the body together, and, at the same time, clamp the tube fitting to the back plate. This model is also supplied with a flange fitting for attaching to the number plate.

Exceptionally neat is the holder, which consists of two parts only, manufactured by Messrs. Grover, Smith and Willis, Winchester Street, Basingstoke. It is constructed of aluminium; the circular front plate is threaded internally, into which a solid back plate is screwed. The back of the holder is flush, with the exception of a raised portion in the centre cut to receive a screwdriver. Two washers are provided, one in front and one behind the glass. A tube fixing is provided, and is held to the body by two bolts, whilst the back flange of the clip extends above the circular back plate and locks it in position.



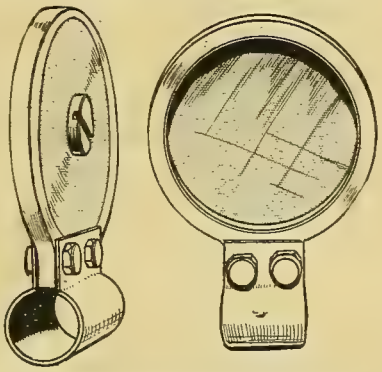
Coventry Plating and Presswork Co.'s holder in non-rusting polished nickel-silver which sells at a moderate price.

Messrs. Brown Bros., Ltd., of Great Eastern Street, is another firm which has introduced a licence card holder, which is, perhaps, the most simple of the many we have seen. Briefly, it consists of a brass tray to take the licence card, rubber ring and glass, the whole being kept in position by a spring ring after the manner of retaining lamp glasses.



The Brown Bros. holder has three types of fixings, for front number plate, handle-bar, and mudguard respectively.

Another firm producing a holder for the number plate is Messrs. Wright and Sons, Edgware, Middlesex. A circular back plate receives the waterproof front plate and glass, whilst the number plate fixing is integral with the rear plate.



The Grover, Smith, and Willis design in aluminium.

The well-known saddle and bag firm of J. B. Brooks and Co., Ltd., Birmingham, manufacture a holder in two patterns, one which screws or bolts flush to any flat surface, and the other is supplied with a strap for attaching to the tank or in a similar position.

One of the few firms producing a square type holder is Car Components, Ltd., 6, Hanover Square, London, W.1. This holder has no flanges, and presents a very neat appearance. It is made for cars, sidecars, and motor cycles; the latter type, equipped with a clip for the handle-bar, costs 9s. 6d.

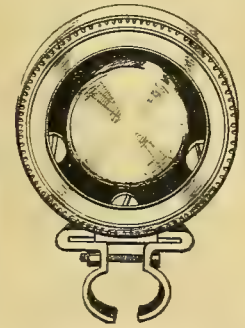
Godfreys, Ltd., 208, Great Portland Street, offer a very handsome holder in brass or aluminium, with clip fitting 5s., or direct fitting 4s., while Gratze, Ltd., have three types—(1) with a lug extension which may be bent to suit individual requirements for 6s., (2) with clip extension at the side for fitting above or below the handle-bar for 6s. 6d., and (3) with clip extending from the centre of the back of the holder at the same price.

W. Brandish and Sons, Foleshill Road, Coventry, are offering a flangeless holder of good design and exceptionally well finished for 2s. 6d. without clips, and 2s. 9d. with handle-bar fittings.

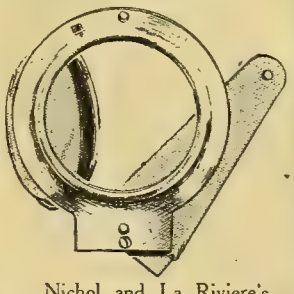
As is to be expected, the Terry holder, made by the famous Redditch spring firm, is a neat and well finished article. Having a nickel-plated finish, it is offered in three types—(1) for fitting to the woodwork of car or sidecar, 5s. 6d.; (2) fitted with a clip at the back of the holder for attaching either to the windscreen, 7s. 6d.; or (3) for motor cycle handle-bars, with an adjustable clip ⅞in. or 1in., 7s. 6d.

The Meteor Manufacturing Co., Ltd., 98, Tollington Park, London, N.4, the makers of the Corona motor cycle, are also producing a licence card holder, as are the Coventry Plating and Presswork Co., Ltd., whose product is illustrated, and F. Line and Co., Buckingham Street, Birmingham.

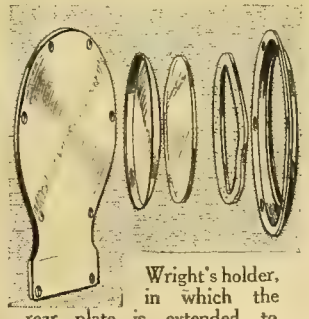
A square holder by Car Components, Ltd.



Smith's holder.



Nichol and La Riviere's method of holding the back plate to the glass rim.

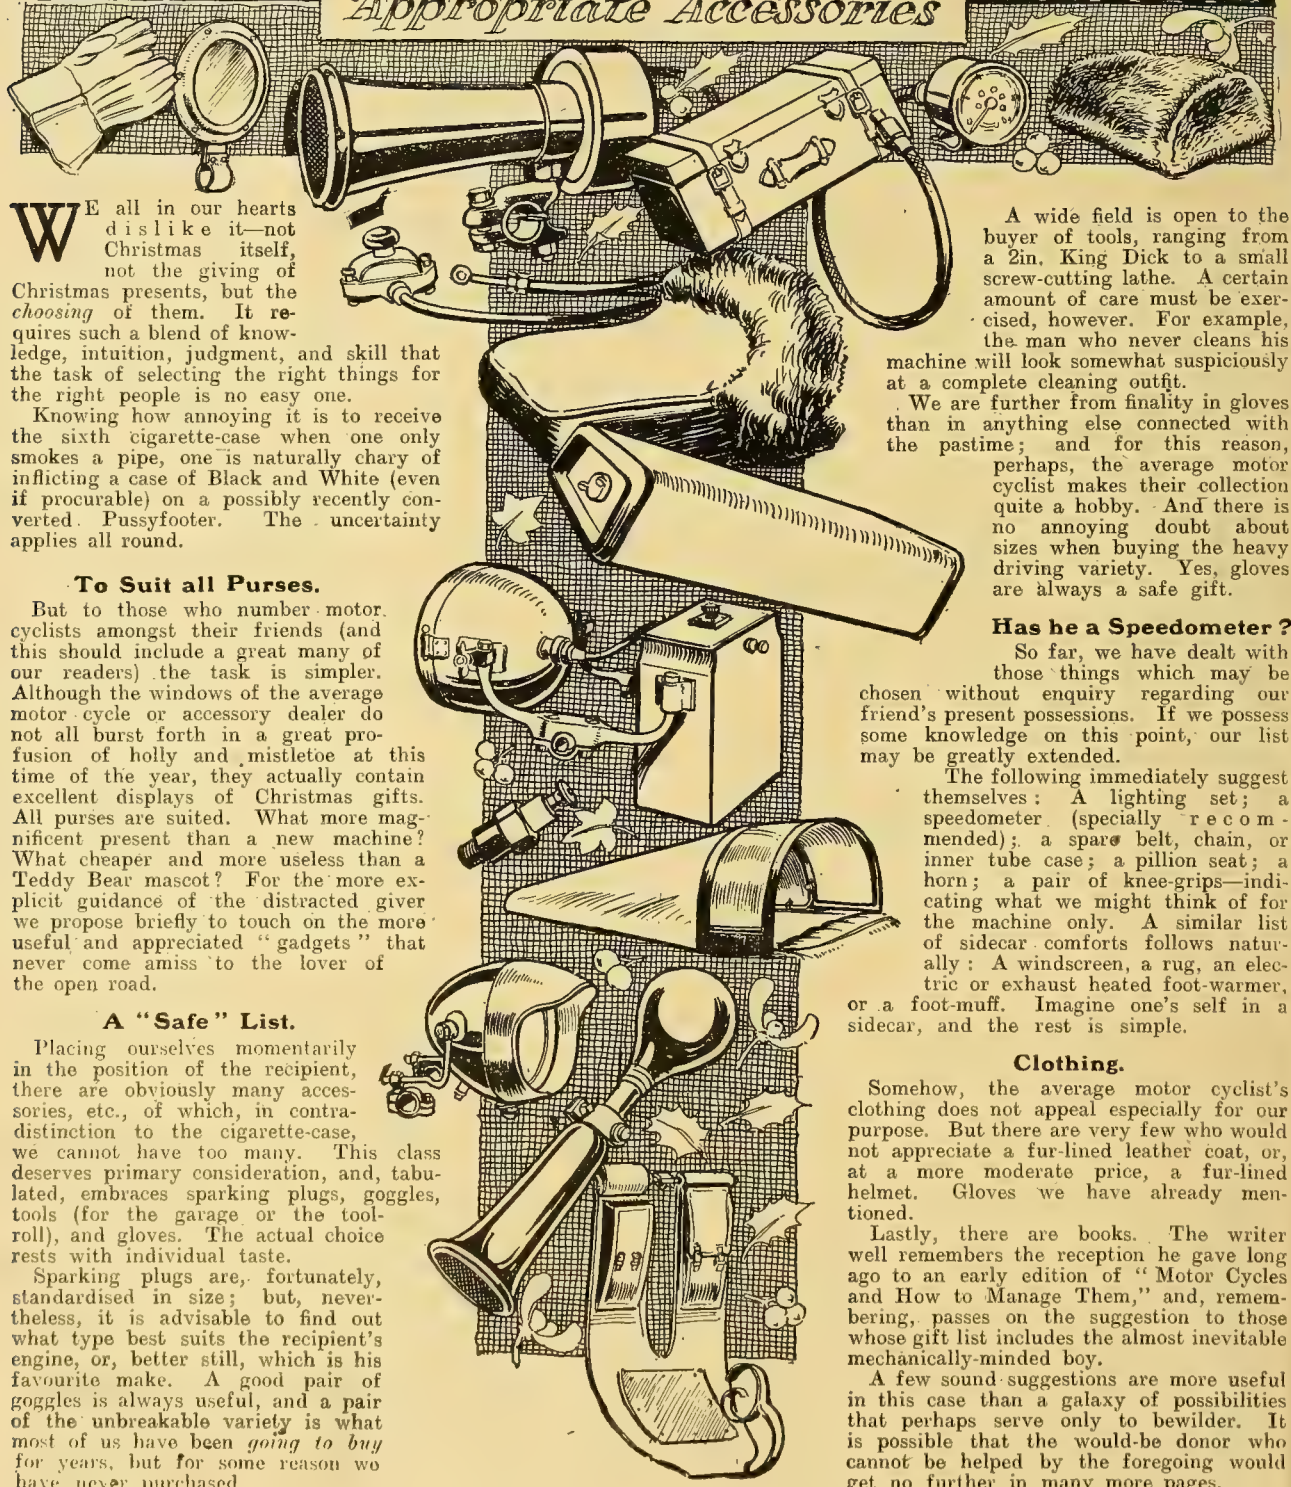


Wright's holder, in which the rear plate is extended to form the fastening to the number plate.

Holder by the well-known Terry spring firm.

Xmas Gifts

Some Useful and Appropriate Accessories



WE all in our hearts dislike it—not Christmas itself, not the giving of Christmas presents, but the *choosing* of them. It requires such a blend of knowledge, intuition, judgment, and skill that the task of selecting the right things for the right people is no easy one.

Knowing how annoying it is to receive the sixth cigarette-case when one only smokes a pipe, one is naturally chary of inflicting a case of Black and White (even if procurable) on a possibly recently converted Pussyfooter. The uncertainty applies all round.

To Suit all Purses.

But to those who number motor cyclists amongst their friends (and this should include a great many of our readers) the task is simpler. Although the windows of the average motor cycle or accessory dealer do not all burst forth in a great profusion of holly and mistletoe at this time of the year, they actually contain excellent displays of Christmas gifts. All purses are suited. What more magnificent present than a new machine? What cheaper and more useless than a Teddy Bear mascot? For the more explicit guidance of the distracted giver we propose briefly to touch on the more useful and appreciated "gadgets" that never come amiss to the lover of the open road.

A "Safe" List.

Placing ourselves momentarily in the position of the recipient, there are obviously many accessories, etc., of which, in contradistinction to the cigarette-case, we cannot have too many. This class deserves primary consideration, and, tabulated, embraces sparking plugs, goggles, tools (for the garage or the tool-roll), and gloves. The actual choice rests with individual taste.

Sparking plugs are, fortunately, standardised in size; but, nevertheless, it is advisable to find out what type best suits the recipient's engine, or, better still, which is his favourite make. A good pair of goggles is always useful, and a pair of the unbreakable variety is what most of us have been *going to buy* for years, but for some reason we have never purchased.

A wide field is open to the buyer of tools, ranging from a 2in. King Dick to a small screw-cutting lathe. A certain amount of care must be exercised, however. For example, the man who never cleans his machine will look somewhat suspiciously at a complete cleaning outfit.

We are further from finality in gloves than in anything else connected with the pastime; and for this reason, perhaps, the average motor cyclist makes their collection quite a hobby. And there is no annoying doubt about sizes when buying the heavy driving variety. Yes, gloves are always a safe gift.

Has he a Speedometer?

So far, we have dealt with those things which may be chosen without enquiry regarding our friend's present possessions. If we possess some knowledge on this point, our list may be greatly extended.

The following immediately suggest themselves: A lighting set; a speedometer (specially recommended); a spare belt, chain, or inner tube case; a pillion seat; a horn; a pair of knee-grips—indicating what we might think of for the machine only. A similar list of sidecar comforts follows naturally: A windscreen, a rug, an electric or exhaust heated foot-warmer, or a foot-muff. Imagine one's self in a sidecar, and the rest is simple.

Clothing.

Somehow, the average motor cyclist's clothing does not appeal especially for our purpose. But there are very few who would not appreciate a fur-lined leather coat, or, at a more moderate price, a fur-lined helmet. Gloves we have already mentioned.

Lastly, there are books. The writer well remembers the reception he gave long ago to an early edition of "Motor Cycles and How to Manage Them," and, remembering, passes on the suggestion to those whose gift list includes the almost inevitable mechanically-minded boy.

A few sound suggestions are more useful in this case than a galaxy of possibilities that perhaps serve only to bewilder. It is possible that the would-be donor who cannot be helped by the foregoing would get no further in many more pages.

To Our Readers.

A Merry Christmas.

A Winter Hint.

Keep your ears warm.

Enthusiasm.

Again a record entry for the London-Exeter run on Boxing Night.

Another Winter Hint.

A stone jar filled with hot water and wrapped in a rug makes an excellent heater for the sidecar.

Components, Ltd.

The balance sheet of Messrs. Components, Ltd., shows a profit for 1920 of £41,277. A dividend of 7½% (less tax) is recommended by the directors.

Engineering Standardisation.

The British Engineering Standards Association has reorganised its section which deals with automobile standardisation, and, to represent the British Cycle and Motor Cycle Manufacturers' and Traders' Union, Mr. F. E. Baker (of Precision engine fame) and Mr. W. Chater-Lea have been elected to the sectional committee.

Modern Definition.

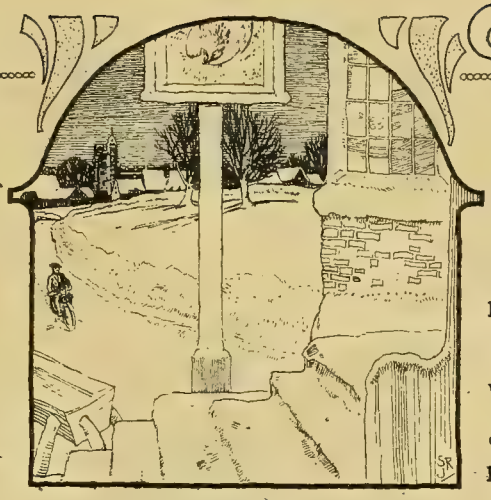
The Motor Cycle recognised the awkwardness of the definition "horizontally-opposed twin" and suggested the excellent substitute "flat twin," a phrase which has come to stay. Now *The Autocar* has performed a similarly good service by recognising the eight-cylinder engine having its cylinders in line, as "The Straight Eight," a terse and apt expression.

For Users of Transport.

Motor Transport is the new title of our sister journal *Motor Traction*, which for fifteen and a half years has faithfully recorded the progress and development of the industrial vehicle industry from the user's point of view. The scope of *Motor Transport* is more fittingly indicated by the new title, the circulation of the journal having grown to over 10,000 copies per week.

Sidecar Taxicabs.

Interest in the sidecar taxi is being awakened in many quarters, and, on Tuesday, December 14th, Viscount Curzon raised the question in the House of Commons, asking the Home Secretary whether he could say what were the serious objections to the use of this type of vehicle in London. He further asked what committee had been referred to on this matter, and when that committee's report might be expected.



Licence Card Holders.

The number of manufactures of licence card holders is now approaching forty.

£50,000 Reward.

The Commonwealth of Australia has increased its offer of a reward for the discovery of petroleum oil in commercial quantities from £10,000 to £50,000.

Distinction for Flywheel Magneto.

From time to time additions representing modern practice are made to the engineering exhibits at South Kensington Museum, and the latest item to be included in the motor cycle section is a Villiers two-stroke engine with flywheel magneto. The Villiers Engineering Co., Ltd., of Wolverhampton, are certainly to be congratulated on the selection of their production for inclusion in such a collection.

Special Features.

THROUGH FEMININE GOGGLES.

TAKING RISKS—A MOTOR CYCLE SHORT STORY.

ON THE OPEN ROAD AT CHRISTMAS.

Essex Index Marks.

In addition to the index marks E and HK, the county of Essex has now NO.

Winter Riding.

Some very pleasant riding was obtained during the real winter weather last week.

Price Reduction.

The A.B.C. motor cycle has been reduced to £140. Its specification now includes a kick-starter.

All-weather Riders.

There are always a good number of machines at the Editorial back door, and the recent severe weather has not reduced that number.

Air and Water-cooled Engines.

The air-cooled engine easily scores over its water-cooled sister at this time of the year, where the fear of burst radiators clouds the car owner's horizon.

On Ice-bound Roads.

A member of *The Motor Cycle* staff, whose daily mileage between home and office is about twenty miles, reports that, while several cars have been seen unable to proceed over the ice-bound roads, not once has he observed a motor cycle in similar trouble.

Some enjoyable riding was obtained last week-end, when the country-side had on its winter garb, and the temperature was not too low.

Singles and Twins.

Fifteen Triumph riders have entered the London-Exeter run, and a similar number are down to ride Harley-Davidsons.

Foreign Decorations.

We offer our sincere congratulations to Mr. Clive Preen, who was the first secretary of the Public Schools Motor Cycling Club, and was lately assistant custodian of enemy property in Egypt, on being awarded the Order of the Nile, Third Class, permission to wear which has been granted by H.M. the King.

Scottish Ex-D.R.'s Reunion.

It is proposed to hold during the Scottish Motor Show in January a reunion and dinner of ex-D.R.'s. All Ex-Signal Service D.R.'s who would like to attend are requested to write to Mr. R. Watson, c/o Jennings Ltd., 86, Mitchell Street, Glasgow. It is to be hoped that considerable support will be given to the first of these ventures to be held in Scotland.

For Men who cannot Motor Cycle.

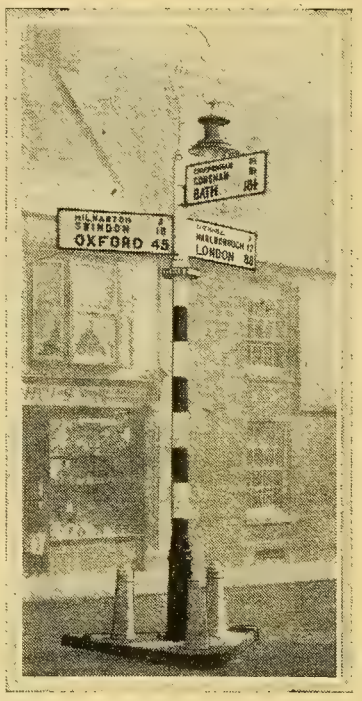
Sir Arthur Pearson is making a further appeal to the public on behalf of St. Dunstan's new headquarters for blinded soldiers. The hostel has still nearly five hundred men in training, some of whom have been prevented by the severity of their injuries from going to the home before, and many others have only lately lost their sight as the result of injuries received during the war. We know our readers will respond as liberally as their means permit. Subscriptions should be forwarded to Sir Arthur Pearson, St. Dunstan's Headquarters, 1, Regent's Park, N.W.1.

The Richmond Meet.

Added interest will be given to next year's annual meet of Northern motor cyclists at Richmond (Yorks.) on Good Friday by the provision of a Yorkshire Centre A.C.U. trophy. This will be awarded to the club with the highest attendance figures, based on percentage of members present multiplied by distance to the rendezvous.

What Might Have Been.

Situated at Calne, the signpost illustrated below was erected in August last by the A.A., and shows the type the Association intended to utilise if its offer, made at the beginning of the year, to signpost any continuous stretch of fifty miles of main road had been accepted. Unfortunately, the surveyors concerned rejected the offer. It will be admitted that the design and bold lettering are admirable. But how long shall we have to wait before this system of signposting becomes universal? Further reference to signposting is made on page 853.



The first national signpost. This admirably designed sign is situated at Calne, Wilts.

Indian Imports.

India imported £750,000 worth of motor cars and motor cycles during September, says the current number of *The Board of Trade Journal*.

Police Activity.

Motor cyclists should note that in certain districts, and particularly between Rushden and Wellingborough (Northants), the police are active in regard to motor cycles not fitted with two brakes. In Fenny Stratford the police are insisting that the 5 m.p.h. limit be observed.

Sidecar Police in New York.

To combat the extraordinary crime wave which at present is sweeping New York, the Police Commissioner has placed eighty motor cycles and sidecars at various points in the city in readiness for instant action. The mobility and speed of the sidecar should prove a big advantage where a gain of seconds means so much.

Second-hand Prices.

Although the second-hand market is undoubtedly slack, there is little sign of a slump, in the true sense of the word, as the following comparative table shows :

Name, Model, and Date of Machine.	Nov. 4th. Lowest and Highest.	Dec. 23rd. Lowest and Highest.
A.B.C., 3 h.p., 1920	£110–£150	£95–£150
A.J.S., 6 h.p., sidecar, 1920 .	£175–£250	£175–£250
B.S.A., 4½ h.p., sidecar, 1920	£130–£175	£132–£160
Douglas, 2¾ h.p., 1916	£45–£68	£38–£65
Douglas, 4 h.p., sidecar, 1920	£110–£160	£120–£155
Enfield, 8 h.p., sidecar, 1920 .	£150–£177	—
Harley-Davidson, 7-9 h.p., sidecar, 1920	£175–£210	—
Indian, 7-9 h.p., sidecar, 1920	£165–£210	£175–£210
Matchless, 8 h.p., sidecar, 1920	£160–£230	£180–£230
Norton, 4 h.p., sidecar, 1920	£125–£145	£130–£150
P. & M., 3½ h.p., sidecar, 1919-20	£95–£135	£118–£130
Rudge-Multi, 3½ h.p., 1920 ..	£80–£100	£80–£100
Scott, 3⅞ h.p., 1920	£100–£125	£110–£115
Sunbeam, 3½ h.p., 1920	£140–£160	£135–£160
Triumph, 4 h.p., sidecar, 1920	£140–£180	£115–£175
Zenith, 8 h.p., sidecar, 1920 .	£128–£198	£165–£180

NOTE.—Where no current figures are indicated, there were insufficient data available.

CLUB NEWS. (Continued from page 843.)

Ilkeston and District M.C.C.

The second annual dinner in connection with the above club was held at the Rutland Hotel, Ilkeston, on Thursday evening, December 2nd, 1920. The chair was occupied by Capt. C. P. Maltby, J.P.

Wallington and District M.C.

The Wallington and District Motor Cycle and Light Car Club held a general meeting at the Greyhound Hotel, Croydon, on Monday, December 6th, when it was decided to change the name of the Wallington Motor Cycle Club to the Wallington and District Motor Cycle and Light Car Club.

Bradford M.C. and L.C.C.

The above club held a "one-day winter trial" for the Spencer Cup (which had to be won outright) on December 12th. There were forty-four entries, and it speaks well for the sporting spirit of the club members that twenty-three riders faced the starter in a blinding snowstorm. The course was a fairly severe one over the Yorkshire dales, and was about eighty miles in length. The start was from the club headquarters, Belle Vue Hotel, Bradford. All previous first prize winners were barred from competing. The competition was a test of map reading, as well as riding to the schedule of 20 m.p.h., and only eight riders, all of whom were sidecarists, completed the course, with the following results : 1 (Spencer Cup), J. C. Neilson (7-9 Harley sc.), total error 38m. 30s. ; 2 (gold medal), H. Fisher (4 Triumph sc.), 40m. 5s. ; 3 (silver medal), W. Clough (3¾ Scott sc.), 46m. 35s. ; 4 (bronze medal), S. Hoyle (7-9 American X sc.), 49m. 30s. H. Baxter (4 Wilkin sc.), H. Firth (3½ P. and M. sc.), Miss N. Suddards (3¾ Scott sc.), and H. K. Watson (3¾ Scott sc.) were the only other four competitors to finish ; and, in view of the very arduous nature of the riding, the committee has decided to award a special silver medal to the only lady rider for her plucky performance of riding throughout a snowstorm, and finishing seventh.

York and District M.C.

The second annual ball of the above club will be held at the York Assembly Rooms, on Friday, January 28th, 1921, commencing at 9 p.m.

Eastbourne and District M.C.C.

The first annual dinner of the above club, held recently at the Gildredge Hotel, was of the happiest character, and, consequently, was thoroughly enjoyed by the eighty ladies and gentlemen present. The chair was occupied by Mr. C. H. Lewis (one of the vice-presidents). The speeches were almost all in more or less lighter vein, and the musical programme was of a most attractive character.

Main Road Travellers to have Right of Way.

Government Scheme for Signposting, and Several Other Important Matters, Discussed at Auto Cycle Union General Committee Meeting.

AT the fourth A.C.U. General Committee meeting of the 1920-21 session held at Cambridge last week several important announcements were made, including reference to the new Government scheme of signposting.

The Secretary reported the invitation to attend the deputation to the Ministry of Transport, and mention was made that the signs agreed upon had been restricted to eight types of road dangers to be indicated by signs and descriptive wordings, somewhat similar to those in use on the Continent. No indiscriminate triangles were to be erected anywhere. At cross roads no warning signs were to be established on main roads, but only on by-roads, thus putting the responsibility on the man entering the main road, and giving the traffic on the main road the right of way.

Anglo-Dutch Trial.

Six members of affiliated clubs and six from the Competitions Committee are to serve on the Anglo-Dutch Trial, and it is hoped to include a representative from the motor cycle manufacturers. The following members have signified their willingness to serve: Messrs. E. B. Ware, F. A. Hardy, A. S. Ross, E. J. Bass, Dr. A. M. Low, and Mr. W. Cooper (secretary).

It is also interesting to have to record that the Auto Cycle Union is seeking to persuade the Royal Automobile Club to hand back the control of vehicles of engine capacity of 1,100 c.c. to the Auto Cycle Union in accordance with international practice, as decided at the last meeting of the International Federation of Motor Cycle Clubs in Paris. It was reported that the matter had been referred to the International Council of Automobile Clubs.

One Day Winter Trial.

It has been decided to hold a one day winter trial for stock machines on February 25th. Though this is an innovation so far as A.C.U. trials are concerned, the idea is a very old one, and it will certainly be both interesting and instructive if only machines actually selected from stock take part.

The 1921 Six Days Trials.

Drastic alterations have been made in the method of running the 1921 Six Days Trials. A sub-committee recently met and made many recommendations, which have now been adopted.

A mudguarding test will be held at Brooklands over a specially prepared surface. There will also be a preliminary high-speed test on the track on the first day of the trial, and twenty-five laps at the conclusion of the trial. Petrol and oil consumption tests will be made for the whole distance.

Open Competition Permits.

It has been decided to increase the number of open competition permits to thirty.

The next General Committee meeting will be held at Shrewsbury on February 2nd.

The 1921 T.T.

Below we give lists of entries already received for next year's Tourist Trophy Races in the Isle of Man:

JUNIOR RACE.

Dr. C. Hopwood (Royal Enfield), Butterfields, Ltd. (three Levises), A. H. Haden (New Comet), A. J. Stevens and Co. (six A.J.S.'s), and E. B. Ware (two J.A.P.'s).

SENIOR RACE.

V. Olssen (Sunbeam), H. Minton (——), T. Vale (——), John Marston, Ltd. (four Sunbeams), Triumph Cycle Co. (three Triumphs), Scott Motor Cycle Co. (three Scotts), Norton Motors, Ltd. (three Nortons), A. J. Stevens and Co. (two A.J.S.'s), Hendee Manufacturing Co. (three Indians), E. B. Ware (J.A.P.), T. Mallon (Sunbeam), W. Royle (Norton), Jack Thomas (Norton), and Scott Motor Cycle Co. (three Scotts).

CLUB DINNERS.

SURBITON AND DISTRICT M.C.C.

ON Wednesday, December 15th, the Surbiton and District M.C.C. held its first annual dinner at the Holborn Restaurant, London, W., when Dr. A. M. Low was in the chair. Mr. A. S. Mays-Smith, in proposing the toast of "The Club," emphasised the progress it had made. Dr. Low, in responding, paid a tribute to Mr. F. W. Barnes, the captain of the club, and Mr. W. Pratt.

A large number of cups and awards were presented by Mr. A. S. Mays-Smith, whilst the Maudes Challenge Shield was handed to representatives of the Surbiton Club.

A further number of cups have been offered for next year's events. They include the Milano, the Cyril Pullen Challenge, the Alec Ross, the East, the Wright, the Amac, the Coulson, the Sproston, and the Mays-Smith Cups.

An excellent musical programme followed the dinner. The performers included "Beatie and Babs."

BRADFORD MOTOR CYCLE AND LIGHT CAR CLUB.

AN evening spent amongst the clubmen of the north serves to demonstrate that the keenness of club life there is by no means on the wane.

Perhaps there is something in the crispness of the mountain air blowing across the moorlands that gives the geniality of outlook, the crisp and racy accents, and the heartiness and zest for sport and social pleasures which were displayed at the Market Tavern, Bradford, on Friday, December 17th. Tables groaned equally with the weight of good things and a display of medals and trophies, which were to fall, or had already fallen, before the onslaughts of some 120 members of the Bradford M.C. and L.C.C.

After the toast of "The King," proposed by the President (Mr. J. E. Fearnley), Mr. H. Harrop proposed the health of "The Club," congratulating it upon its rapid development and expressing a hope that the body was now strong enough to re-establish club premises of its own. Mr. T. G. Bullus responded and traced the history of the club from May of this year, when it was revived (after six years of quiescence) by a band of thirty-eight enthusiasts; at the present moment the membership numbered 330. He laid particular stress upon the enthusiasm of the hon. secretary, Mr. W. A. Dovener (known affectionately as "The Live Wire"), whose efforts never ceased; it was this enthusiastic official who, at the very first meeting of the revived club, introduced forty-two new members, and it was he who engaged a band to attract the public to the hill-climb at Rosedale Abbey Bank immediately after the Six Days Trials.

The evening was brought to a close by the toast of "The President," proposed by Mr. S. Haigh.

COVENTRY AND WARWICKSHIRE M.C.

THE club president, Mr. E. Manville, M.P., occupied the chair at the Coventry and Warwickshire Motor Club's annual dinner on Friday last. There were present about one hundred members and guests, including the Mayor of Coventry, and representatives of the Cycle and Motor Cycle Manufacturers' Union, the A.C.U., and the A.A.

Major Watling (C. and M.C.M. and T.U.), in proposing "The Club," touched on the energy displayed by the officials of the club. Mr. Victor Holroyd, one of the founder members, replied, and drew attention to the fact that several of the original club officers were present.

In proposing "The Visitors and Prize Donors," Mr. E. M. Iliffe, C.B.E., emphasised the need of healthy competition, and thanked the prize donors for the encouragement they had provided in this direction. Replies were made by the Mayor of Coventry, Capt. Fryer (A.A.), and Maj. Dixon Spain (A.C.U.).

Replying to the toast of "The President," wittily proposed by Mr. E. M. C. Instone, Mr. Manville spoke of his Parliamentary duties in connection with motoring activities, and pointed out the importance of the club as representing the centre of the motor industry in the field of sport.

During the evening the President distributed the prizes won during the year, and an excellent musical programme was included. A golden goblet is to be offered as the chief award in a twenty-four hours reliability trial next year.

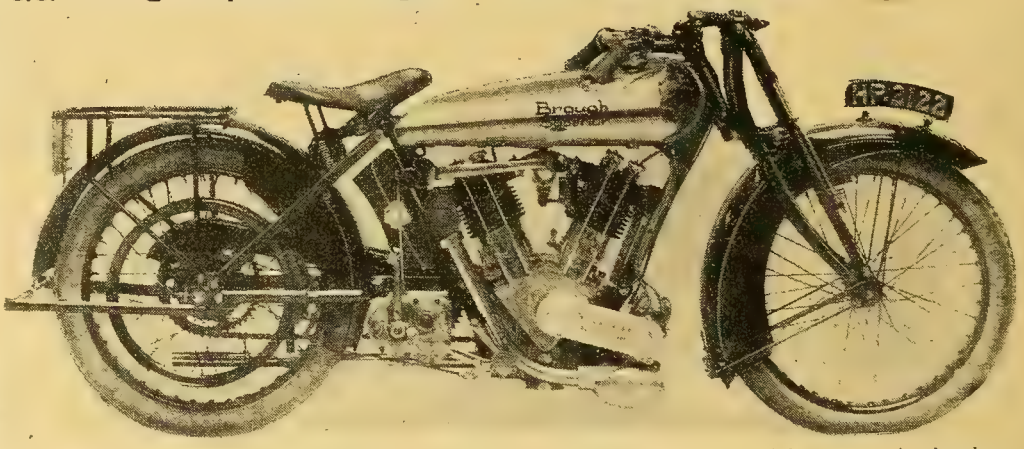
A BIG TWIN SOLO MOUNT.

The 980 c.c. Brough-Superior Designed for the Sporting Rider.

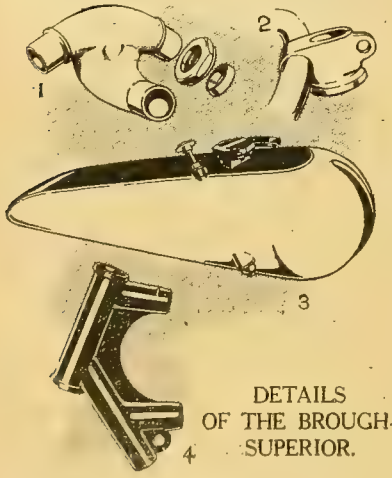
FOR some time past we have been urging that the claims of the purely solo rider should receive special attention. The 1920 Olympia Show demonstrated the fact that many manufacturers once again have their eyes on this important market. Unfortunately, however, one of the most interesting products of specialisation in this direction was completed just too late for exhibition.

Mr. George Brough, whose performances in many trials, notably the Scottish Six Days, are well known to most motor cyclists, decided, some months ago, to specialise on a super sporting machine, and informed us at that time that it was his intention to produce a fast, light, and well-equipped motor cycle, which should include all necessary fittings, but no fancy attachments, and, after inspecting his latest production, we may safely say that we have never examined a more sensibly equipped big twin solo mount. To begin with, large tyres (700×80 mm.) are used, and the designer has not forgotten that mudguarding is just as important for the solo rider as for the sidecarist. In consequence, really wide guards, with deep valances, are included. The chains, it is true, are covered only as regards the top run, but the majority of sporting solo riders will prefer this accessible arrangement to the entirely enclosed type.

The popular 90 × 77 mm. overhead valve J.A.P. engine has been specially redesigned to suit the requirements of Mr. Brough, and the light rocker gear and superb finish are outstanding features which catch the eye. Added to this, we are told that, with the aid of a special Amac carburetter which is being supplied for the machine, the engine will tick over at the merest "crawl" and yet accelerate with a rush.



A big twin designed for solo work, the 8 h.p. overhead-valved Brough-Superior, which has a large plated tank.



DETAILS OF THE BROUGH-SUPERIOR.

(1) A cast aluminium inlet pipe with cone and nut air leak preventers.

(2) The handle-bars form a unit with the head clip.

(3) The saddle tank has no flats or corners; it is plated, and has a black top panel, and hexagon top filler caps are fitted.

(4) A strongly webbed casting is employed for the head lug, which is formed in a single piece.

In proof of this statement, each machine will be guaranteed to do from 8 to 80 m.p.h. on top gear. It is never an easy matter to dispose of the exhaust pipes of an overhead valve engine, but, in this case, the difficulty has been overcome in an extremely neat manner.

A well ribbed cast iron port is screwed on to each exhaust outlet, taking the place of the usual exhaust pipe nut and the curves necessary to avoid the frame tubes are smooth and easy. From these ports, pipes lead to a large two-piece aluminium silencer placed forward of the engine and below the magneto; from this silencer a tail pipe extends rearwards.

High Gear Ratios.

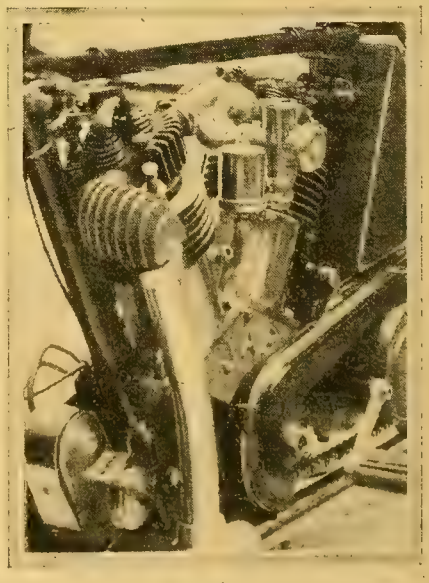
To the bottom bracket is attached a Sturmey-Archer gear box, having strengthened teeth and a six-plate clutch. The gear ratios provided by this box are 2.94-1, 4-1, and 5.9-1; such high ratios are, of course, only suitable for high-powered solo machines, but with the excellent pulling qualities of the overhead valve J.A.P. engine they should be low enough for any ordinary work, and, incidentally, should provide extremely nice top gear running at medium and high speeds. An Enfield type shock absorber is mounted in the rear wheel, in order to mitigate any tendency to "snatch."

Compactness characterises the framework, and, by means of careful design, it has been found to be possible to house the big engine in a machine having a wheelbase of only 55in., and a saddle height of under 30in. Naturally, a sloping top tube is used, and the large saddle tank is rounded giving a capacity for no less than 2½ gallons of petrol and half a gallon of oil.

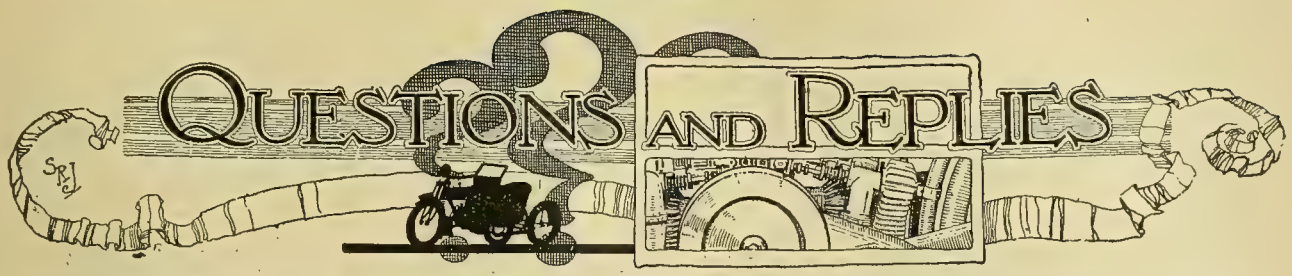
Two points immediately strike the observer's eye; first, that the large filler caps are of the hexagonal composition type frequently used on car radiators, and, secondly, the plated finish which is set off on the upper surface by a black panel with a narrow gold line to relieve the meeting of the two colours. It is, perhaps, surprising that sidecar lugs should be incorporated in the frame of a purely solo motor cycle, but it is a proof of the fact that Mr. George Brough knows his public, for sooner or later someone will attach a sporting sidecar, and integral lugs are certainly preferable to clip joints.

Ready for the Road.

All detail work is beautifully carried out, and there is an absence of clips which will gladden the eye of the critic. The handle-bar is brazed into the head ball race lug, and a special lamp bracket springs from the base of the Brampton Biflex forks; incidentally, an acetylene lamp and generator will be supplied as part of the equipment unless Lucas Magdyno is specially ordered.



Usually with an overhead valve engine the exhaust pipes are very prominent. The Brough-Superior is exceedingly neat in this respect.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

Automatic Inlet Valve Engine.

Will you please tell me how to set the valves on a Kerry engine? The inlet valve is of the suction type, and is placed at the end of the induction pipe.—H.H.

The inlet valve works automatically, and the exhaust valve should be set so that it is just closing when the piston reaches the top of the stroke.

Engine Location in Cycle Car.

I am contemplating building a light three-wheeled monocar, and am installing a 3½ h.p. air-cooled engine. The whole outfit will not exceed the weight of a solo motor cycle of the same power. Do you think cooling would be satisfactory, if the engine were fitted behind the seat as in the A.C. Sociable (less fan flywheels) but enclosed at the top and sides with air scoop at bottom facing forward?—C.W.

In all probability you will find that the engine will overheat, especially at low speeds when running on bottom gear. It will be much better to fit the engine at the front of the chassis in order to give it the full benefit of the cooling draught.

Consumption and Tyre Life.

My machine is a 1920 4¼ h.p. B.S.A. all-chain drive with sidecar. It has gear ratios of 5-1, 8-1, and 13.2-1, and the total weight of driver and passenger is 24 stones. The tyres are 26×2½in. Palmer cord on all wheels. Assuming that it is carefully driven (about 18 m.p.h. average): (1.) Are the gear ratios about right? (2.) What mileage per gallon of petrol should I obtain? (3.) What mileage per gallon of engine lubricating oil? (4.) What mileage should the rear tyre give, also the other tyres? (5.) Would larger tyres, say, 26×3in. to fit 2½in. rims, be an advantage?—W.H.P.

(1.) The gear ratios should be quite in order. (2.) About 70 to 80 m.p.g. (3.) About 1,000 m.p.g. (4.) The mileage which you will obtain from tyres depends on several factors, methods of driving and luck being the most prominent. Given reasonably good fortune, you should obtain from 2,000 to 3,000 miles from the back cover, while the tyres on the front and sidecar wheels should last about 5,000 to 8,000 miles. (5.) 26×3in. tyres would have the effect of raising the gear slightly; they would also make the machine much more comfortable, and in all probability they would wear longer. There is no objection to fitting them.

Life of Chains.

After having run a ⅝in. × ⅜in. British chain for 4,500 miles as final drive on a 7-9 h.p. American machine, I find it has stretched to such an extent that the rollers will not fit down into the sprocket on the driving wheel, but rides some ⅛in. up for about one-third of the distance of travel round the wheel. There is now 1½in. up and down play between the sprockets for over half the length of the chain, while for 3in. or 4in. the chain is almost rigidly taut. Kindly inform me: (1.) Is this harmful to the chain or sprocket? (2.) Is this amount of stretch abnormal? (3.) What is the average life in miles of chain of this size?—HIRADIN.

(1.) The chain is apparently worn out, and you should not attempt to use it any longer, as in all probability it will spoil the sprockets. (2.) The amount of stretch in the chain varies considerably with the care that has been expended on the transmission during the time the machine has been in use. An exposed chain should be removed from the sprockets every 500 miles, soaked in paraffin, and then dipped in molten tallow. (3.) The average life of the chain cannot be given in definite figures; it all depends on the conditions under which it has been used. We do not think, however, that you will obtain a much greater mileage than 6,000 from the unenclosed chain.

Changing an Engine.

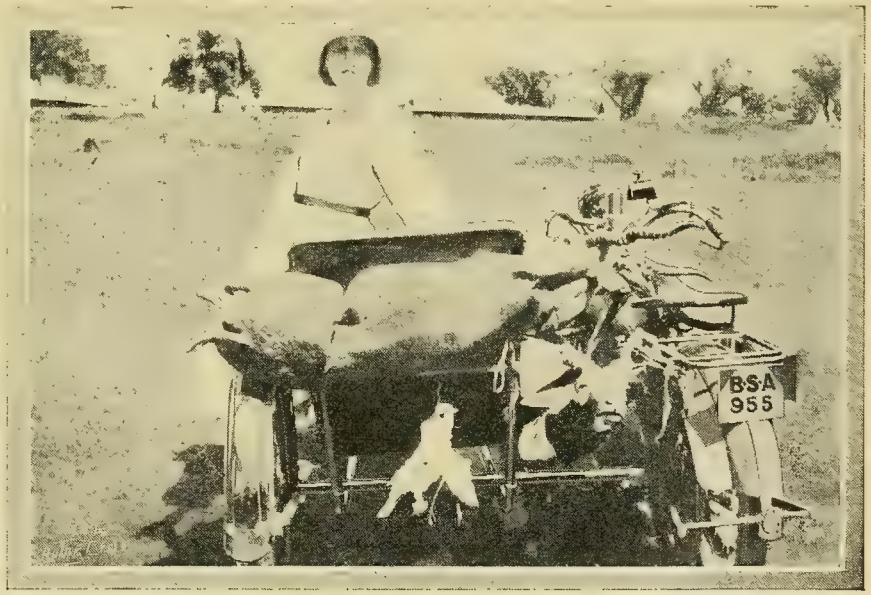
I have a 4 h.p. 1918 W.D. machine, and wish to fit a twin engine of about 5-6 h.p. to replace the single-cylinder engine. Is this a workable proposition?—H.W.G.

A certain amount of structural alteration to the frame of the machine might be necessary, but it should not be beyond the capabilities of the average motor cycle repairer. There does not appear to be any other objection to your scheme.

Oversize Tyres.

What is the largest size cover that can be fitted to a 26in. × 2¼in. D section motor cycle rim? Will a 26in. × 3in. × 2¼in. fit? Apparently a 3in. to fit a 2¼in. tyre is not made. At present I have the standard 26in. × 2½in. × 2¼in.—R.A.Y.

The largest section tyre made for the 26in. × 2¼in. rim is 26in. × 2½in. for 2¼in. Several makes of 28in. × 3in. American size tyres, however, *can* be used on this section of rim, but the tyre makers neither guarantee nor recommend them when so fitted.



THE SIDECAR IN CENTRAL INDIA.

One has to live in countries where railways are scarce and transport difficult to appreciate fully the handy sidecar. Here is shown a B.S.A. outfit used to take home black buck brought down in the central provinces of India.

Cleaning Inside of Exhaust Pipes.

(1.) The exhaust pipes of my twin engine are badly choked at the bends with carbon. What is the simplest way of removing this deposit? (2.) I am running my 3 h.p. twin J.A.P. engine on a fixed gear of 5 to 1. Do you consider this about satisfactory? (3.) What do you consider to be the highest possible road speed attainable on this gear ratio? (4.) Kindly state the best valve setting for this engine—*(a)* for general work; *(b)* for speed work.—H.C.B.

(1.) Heat the pipes to a dull red. This will loosen the carbon inside them, and the bulk of it can then be knocked out. (2.) If most of your riding is on reasonably level roads the 5 to 1 gear should be fairly satisfactory, but it is quite likely that a slightly lower gear would give more speed. (3.) 45 to 50 m.p.h. (4.) Unless you have facilities for making special cams, we do not recommend that you depart from the normal valve timing. This setting is as follows: With piston on top dead centre, the exhaust valve should be just closing and the inlet just commencing to open.

The Date of a Machine.

I recently purchased an A.J.S. outfit, and should be extremely obliged if you could enlighten me upon certain points regarding it. (1.) When purchasing this machine I was under the impression that it was of 6 h.p., but upon measuring the cylinder its dimensions were 70 mm. bore × 83 mm. stroke, and I came to the conclusion that it was 4½ h.p. Is this so? (2.) This machine is fitted with a two-speed gear box, but I see no means of lubricating the gears. Should this be packed with grease when assembled, or is there any other provision for lubrication? (3.) A hand-controlled clutch is fitted, apparently of the cork insert type, operated by a powerful spring. How can I tell when this spring is in correct tension? Also, is there any way of treating the corks to make them grip well? (4.) A U.H. magneto is fitted, which also seems to have no provision for lubricating. Should this be oiled, or should it run dry? (5.) Is this type of machine still made, and, if not, can you tell me its date?—J.B.G.

(1.) The machine is a 5 h.p. model, the cubic capacity being 638 c.c. (2.) The gear box should be partly filled with thick oil, and this should last for about 1,000 miles. (3.) If there is no slipping you may rest assured that the pressure on the spring is sufficient. The best method of arriving at the correct adjustment is to unscrew the adjusting nut until the clutch slips under load, and then screw up again until the slipping is just eliminated. The cork inserts do not require any dressing, but they should be quite free from oil or grease. If the clutch slips due to any of the gear box lubricant finding its way on to the corks they may be washed with petrol. (4.) No provision for lubrication is made on the U.H. magneto The bearings are packed with grease when assembled, and will run for 3,000 to 5,000 miles without attention. (5.) Many improvements have been made in later models; yours appears to be of the 1913 type.

READER'S REPLY.

Effects of Prolonged Wear.

I have a 1918 4 h.p. Triumph, and although it has done a considerable mileage, it is by no means excessively worn, but it manifests the same "jumpiness" in second gear that "H.C." complains of in your issue of December 9th. The effect is similar to a misfire, although not a misfire, and the jump of the machine occurs every ten yards or so, and is accompanied by pronounced grinding from the gear box. Whilst at the Show I was advised to use thicker oil in the gear box (such as Ambroleum), but I have been unable to try this remedy as yet.—W. A. BOURNE.

SPARKLETS

A Precision Depot in London.

The makers of the Beardmore-Precision motor cycles (Messrs. F. E. Baker, Ltd., King's Norton, Birmingham) have established a London depot at 112, Great Portland Street, W.1.

Aluminium Pistons.

Motor cyclists with a *penchant* for tuning and the modification of existing machines will be interested to learn that Ricardo slipper pistons for a number of standard machines can be obtained from Messrs. Bentley and Draper, Ltd., 4, Fenchurch Avenue, London, E.C.3.

Sidecar Upholstery.

A Sandum sidecar is being exhibited in the showrooms of the Rexine Co., Ltd. (Rexine House, 42, Newgate Street, London, E.C.2), in order to illustrate the use of Rexine in sidecar upholstery.

Magneto Matters.

A little booklet, listing successes won with E.I.C. magnetos throughout 1920, has just been issued. The claims made include reliability, endurance, stamina, and waterproofness, and on the page opposite to that on which each of these items appears are given details of numerous corroborative performances accomplished in competitions.

Catalogues Received.

WILKIN MOTOR CYCLES.—Describing the popular Wilkin machines which distinguished themselves during 1920, especially by the famous ride round the coast under A.C.U. observation.

CLAYTON-WRIGHT ACCESSORIES. A catalogue published by Messrs. Clayton-Wright, Ltd., Great Hampton Street, Birmingham, containing a selection of motor cycle horns and mirrors.

Lubricating Exposed Chains.

We have had many queries of late as to the life of chains on machines with an exposed rear transmission, and our answer in all such cases must be that the service obtained depends entirely upon the care bestowed upon them. An exposed chain should be removed every 500 miles, thoroughly cleaned in paraffin, and then soaked in a warm mixture of oil and graphite; this process is ideal—for the chain! Few riders keep up this practice rigorously, and, as an admirable alternative method, we can recommend that the chain be treated at frequent intervals with Chemico chain lubricant. This preparation is in the form of a solid stick of mixed grease and graphite which is rubbed on to the chain while the latter remains on its sprockets; once on the chain it works into the bearings instead of being flung off, as is a surface dressing of oil. Incidentally, this is only one of the many useful lines produced by the County Chemical Co., Ltd., of Birmingham, whose wares extend from vulcanisers to patches, sparking plugs to rubber solution, and enamels to carbide.

CALTHORPE

When judged by the standard of "actual value for money," CALTHORPE Motor Cycles easily "top the bill"—compare their value with other makes.

In the CALTHORPE, the prospective buyer has a range of high-class, well-finished, fully-equipped machines, listed at exceptionally reasonable figures—an "economy" proposition not to be passed by.

There are three models: the CALTHORPE 3 h.p. 2-stroke Combination at 110 Guineas, complete with Lighting Set; the 2¾ h.p. CALTHORPE-J.A.P. at 70 Guineas; and the 3 h.p. CALTHORPE 2-stroke at 65 Guineas, and specially note this—

Our 3 h.p. 2-stroke Combination at 110 Guineas is practically equal in power to the 3½ h.p. models of other makes listed at much higher prices.

This outfit perfectly meets the demand for a light, reliable, and economical passenger machine. It will take all reasonable hills, and comfortably averages 20 to 25 m.p.h. Approximate petrol consumption, 75 m.p.g. Specification includes 3 h.p. PECO 2-stroke engine, 2-speed Sturmey-Archer Gear with Clutch and Kick-starter, M-L Mag-Dynamo Lighting Set, Complete with light type Coach-built Sidecar.

In your own best interests, and before you decide on any other machine, send for complete information, and see what CALTHORPE value really is.

Calthorpe Motor Cycle Co.

1921.

For 1921 we are concentrating on an exceptionally high-class 2¾ h.p. Solo Motor Cycle and a 3 h.p. model which is suitable alike for Solo or Sidecar work. The engine used in each case is the BLACKBURNE, and we have not succumbed to the temptation of fitting the higher powered engine into the lightweight frame, or vice-versa. The two models are separate and distinct, each being specifically designed for its own particular purpose.

The prices are 99 Guineas and 120 Guineas respectively, and we guarantee THESE PRICES TO REMAIN CONSTANT TILL MARCH 1921. Highly finished, luxuriously equipped, and efficient to the last degree, we claim each to be the best in its class on the market.

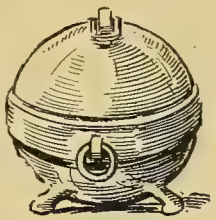
Godfrey's Genie

There was no doubt about its being Christmas Eve. The Calendar proved it for one thing, and it snowed heavily, for another. Besides Godfrey's had closed its doors at 5 o'clock sharp—which was perhaps the most conclusive evidence of all.

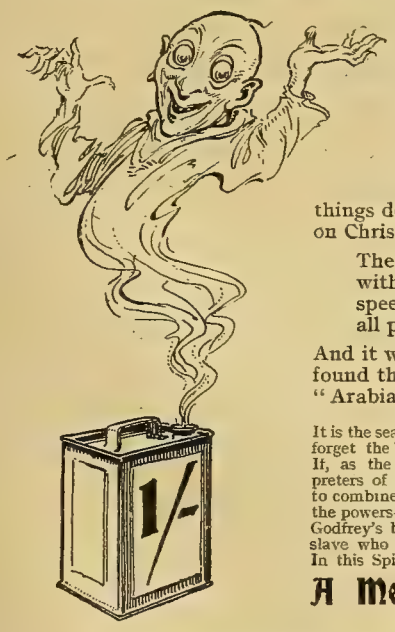
The Managing Director knew it was Christmas Eve. Of course he did. How could it be otherwise when all the letters he had signed that afternoon wished the recipients "The Compliments of the Season.

He thought of this when he reached his home and congratulated himself on the host of new friends which Godfrey's had made during the year, and the multitude of old friends to whom the House owed so much of it's success.

Reviewing the past naturally led to a mental speculation as to the future of the motor cycle industry. Perhaps a good dinner and the genial warmth of a log fire made him more optimistic than usual; perhaps the sound position of his firm and its ever growing popularity had something to do with it also. Be that as it may, he arrived at the very definite conclusion that the outlook for the New Year was decidedly bright, and that the pessimists were all wrong.



In this happy frame of mind he filled his pipe and reached for a quaint old brass lamp which had long been converted into a petrol lighter.



To his amazement it lit without any assistance on his part. With a sub-conscious effort he rubbed the lamp and exclaimed, "Now for the genie."

Scarcely had the words been uttered, when the lights went out, the yule log flared up, and the genie appeared before him, crying "What are thy commands? I am ready to obey thee as thy slave."

The best of employing a genie is that one gets things done quickly, so that by the time the bells rang out on Christmas morn—

> The new taxation scheme, and all motor taxes, had been withdrawn. Petrol was down to 1/- per gallon. The speed limit of 20 miles per hour had been removed, and all police traps abolished.

And it was the same bells that awakened the dreamer, who found the fire out, the lights full on, and a copy of the "Arabian Nights" lying at his feet.

It is the season for dreams and good actions, for idle fancies which help us to forget the Tax Collector and the every-day cares of life.
If, as the Philosopher Montaigne contends, dreams are the true interpreters of our inclinations, should not this idle dream of Godfrey's urge us to combined efforts to secure 10r motorists more considerable treatment from the powers-that-be.
Godfrey's believe in Genie, and Godfrey's Genie is "Service"; the ever-ready slave who anticipates the wants and desires of all its customers.
In this Spirit we again rub the lamp, and this time the wish is

A Merry Xmas and a Happy New Year

Are you a "handy man about the house"?

Or do you call in your next-door neighbour to help you out of many of those little "ticklish" jobs which you could do as well as he if you only knew how?

One job you can do is repairing your own boots and shoes with

DAVIS' USTIKON SOLES

You don't have to be a *craftsman* to put these soles on, but you will be surprised to see how "crafty" you will have become as soon as you have repaired a boot. No apparatus or heat is required. The method is simplicity itself.

GENTS', all sizes 3/9
LADIES', all sizes.. .. 2/9

Complete with Sol-fix and directions.

USTIKON HEELS

The wearing quality of these Heels is indicated by the fine workmanship and careful finish. In actual wear they are still better than you expect.

CHRISTMAS
To our friends everywhere.

WE, the Managing Staff of the Layton Garages, beg to wish you a Christmas full of peace, hope, and joy.

We desire also to express heartfelt thanks for the kindness experienced at your hands, and to assure you that our gratitude is unbounded and sincere.

One outstanding factor that has contributed towards making the Layton Garages one of the very best and largest motor cycle businesses in the United Kingdom, and that, in spite of the fact that Bicester has only a population of 3,000, is the courtesy and kindness you have so freely extended to us. You have treated us like men, and we have tried to justify your confidence. Our business is strong, and we are stronger because of the contact with your personality; in other words, our success is yours, and we most gratefully acknowledge the fact.

It is our hope that we may enjoy your friendship unceasingly, and our plans for 1921 are so arranged that no transaction carried out with us can ever give you cause for regret. We will only permit the *BEST* goods to come into our stock, so that you can never buy anything other than one thing from us—and that is satisfaction. Always we will keep before us the value of your confidence and friendship. We shall protect you, and *never*, if we can help it, shall you regret coming into our circle.

The object of this advertisement is not to sell you anything—it is simply our desire to say "Thank you" in the most sincere manner, but if you have queries that you wish to put to us, we are here surrounded by what we believe to be the very best motor cycle stock in England, and are at your service entirely.

But, above all things, do not forget that to-day, more than ever, our gratitude and best wishes are *YOURS*.

J. W. TOLLADY,
General Manager.

BODIES.

SIDECARS, beautiful coachbuilt bodies, many designs and colours to choose from; aprons, hoods, wind screens, repairs, Trade supplied.—City Motor Co., 121, 123, 125, London Rd., Manchester. [0004

SIDECAR Body Designs for the trade only. Working, coloured, pencil, or line drawings of original designs, also working drawings, full-sized or to scale.—Cooper's Vehicle Journal, Ltd., established designers to the coach trade for over 80 years. Consult us when designing new ideas.—20, Tudor St., London, E.C.4. [0004

SIDECAR ATTACHMENTS.

S

FOR

SANDUM, the Smart Sidecar Specialists.

SANDUM Sidecar Catalogue for 1921, the most comprehensive in the trade.

SANDUM Sidecars.—No. 1 De Luxe, £24/10; best value in Olympia Show.

SANDUM Models. The Exquisite £24/10, and Sport £28/10, are of distinctive appearance.

SANDUM Elite Sidecar, £28/10; the smartest sidecar on the road; highly recommended in "The Motor Cycle."

SANDUM Sidecars, prices to suit all, from £16/16 to £50; absolutely honest value.

SANDUM Dual Purpose Sidecar (patented). A single or 2-seater sidecar as required in 5 seconds. Size of body as our single-seater Elite. Luxuriously comfortable seating for 2 adults, with the weight in correct position over rear axle. Finished in colours to suit any make of machine, £45, bodies only, £22/10. The latest development of the 2-seater as designed by us, and approved by the recognised experts.

SANDUM.—Insist on Sandum enclosed wheel chassis or on girder type chassis

SANDUM Screen, £4/10; easily operated by passenger, with screen in any position.

SANDUM Featherweight Streamline Body, smart and racy, weight 18 lbs., locker in back and under seat; when not in use the seat back hinges forward and neat coverall encloses the whole; price £4/17/6.

SANDUM Hoods, plated fittings, suit any body; immediate delivery; £3.

SANDUM Sidecars.—Wholesale manufacturers of coachbuilt bodies, chassis, hoods, screens, and aprons.

SANDUM Sidecars.—The most noted body-builders in the country.

SANDHAM Engineering Co., Ltd., 336, Gray's Inn Rd., W.C.1. 'Phone: Holborn 933. Factories: 162 to 165, Pentonville Rd., N.; and Britannia Works, Britannia St., W.C. [0015

CAMBER Lightweight Sidecars; £16/10.

CAMBER Semi-touring Sidecars; £20/15.

CAMBER Tandem Sidecars; £27/10.

CAMBER Sidecars; lists free.—Bright and Hayles, 78, Church St., Camberwell, London. 'Phone: Brixton 2951. [418

FLOAT Sidecars.—Manufactured by McConnell and Bailey, 73, Gt. Portland St., W.1.

FLOAT Sidecars.—Immediate delivery to fit all makes of motor cycles.

FLOAT Sidecars.—Write for illustrated list; price 28 gns. complete with chassis and tyre.

FLOAT Sidecars are fitted with underslung chassis; call and inspect at above address.

FLOAT Sidecars in stock at McConnell and Bailey's, 73, Gt. Portland St., W.1. [705

HARLEY, Excelsior, and Henderson.—New De Luxe bulbous back sidecar, 28×3 tyre; £39/19.—Below

SWAN Sporting Sidecar, for American Ex.—Motor Exchange, Horton St., Halifax. [424

ROYAL Leicester Sidecars to suit all machines, roomy bodies, comfortable upholstery, excellent springing, prices from £19/10 upwards.

SEND Your Sidecar to us for renovation. New hoods, wind screens, and aprons fitted. Write for catalogue.

THE Willowbrook Co., Royal Leicester Sidecar Works, Belgrave Gate, Leicester. [033

TURNER Coachbuilt Sidecar, touring, re-enamelled as new, 26in. wheel; £11/11.—Quenby, Middle Rd., Lymington, Hants. [406

SIDECAR, cane canoe body, new chassis, tyre, and tube, only driven 5 miles; £12.—Blake, Polsmooth, Cornwall. (D) [409

1921 Harley Sidecar, £42; brand new; list £49/10.—Edwards, 50, Harrington Rd., South Kensington. Tel.: Kens. 3709. [458

FLYING Middleton, 1920, little used, complete, perfect; any offer for quick sale; seen London.—Box 1,076, *c/o The Motor Cycle.* [446

The New Year.

AT a moment when a wave of trade depression is sweeping over the world one is apt to take a rather gloomy outlook of future events. There is, however, a brighter side to the picture which concerns the motor cycle industry. From the date of the Armistice till the summer of 1920 there existed an entirely fictitious state of trade induced by a rush of purchasers who were once more free to use the roads after the war period. The end of this scramble for machines unfortunately coincided with the normal yearly easing of orders and also with a state of world-wide trade depression.

There is, however, no need to be pessimistic with regard to the future of the motor cycle industry. We are settling down to a normal state of trade, and there is every prospect of a brighter outlook in a few months time. Motor cycles have proved their value in times past, and are daily becoming a necessity to an ever enlarging public. Their economy of running is a sure magnet in these days.

In addition, the majority of motor cyclists are enthusiasts who keep their machines for only a year, and there are still large fields to be explored in the Overseas market. Again, a belated reduction in petrol prices will improve matters.

Interest in competition work is increasing, and the keenness of the club man shows no signs of waning; therefore we feel that we are expressing no idle hope when we wish all readers of *The Motor Cycle* a Happy and Prosperous New Year.

The 1921 Six Days Trials.

ELSEWHERE in this issue will be found a *résumé* of the suggestions on which the A.C.U. proposes to base the regulations governing next year's Six Days Trials.

A perusal will show that the so-called freak hill policy which reached its culmination last September is to be discontinued, and that the forthcoming event will be over a route of much less intrinsic severity; greater technical demands, however, will be made, and we are promised that the machines will be subjected to much more rigorous examination, both before and after the riding tests, which are to commence and finish with certain performances on Brooklands. Silence, springing, braking systems, and oil retention are all marked down for criticism, and as opposed to more sporting events in other places, the "Six Days" tends to become still more a mass of regulations. If it was definitely manifest that these ordinances were introduced for the all-round betterment of motor cycle design, there would surely be no cause for complaint; but one regulation alone shows that the suggestions do not emanate from a source which keeps in view the universality of the motor cycle. We refer, of course, to the reservation respecting machines of over 350 c.c. capacity, *which will be compelled to draw a sidecar*. This proposed ruling discourages at one swoop the more powerful solo machines. If it is carried into effect, such features as ease of steering, weight distribution, light frames for solo use, and general "manageability" are almost entirely discounted in a class of machines which remain universally popular. Useless to argue that the trial is over roads which will make no demands on the larger solo machines, since good steering qualities, easy control, and particularly weight reduction are essential to all types of solo machines, whether on freak hills or elsewhere.

A wiser provision would have been that all machines listed by the makers for sidecar use should be entered with sidecars attached; such a proviso would prevent the makers of double-purpose outfits from confining their appearances in public tests to the solo classes, which is probably what the A.C.U. aims at doing.

After all *The Motor Cycle* has done to encourage the lightweight motor cycle, it is good to observe that the A.C.U. will encourage lightweights, particularly those in the 200 lb. class.

An index to the advertisements in this issue will be found on the page facing the back cover

OCCASIONAL COMMENTS

BY IXION

Naked Chain Life.

A MEDICAL reader has sent me without comment a filthy package on which I was fool enough to pay excess postage. I will scrag my friend when I meet him, for the package merely contained a worn-out chain. It has done 4,021 miles on a 7-9 h.p. combination, running without a chain case. During this mileage, which was mostly town work, and full of stops and starts, the chain has broken thrice. Once as the result of a piece of wire becoming entangled with the hub. Once because the spring clip was put on the wrong way round. Once from sheer inanition. Does my correspondent mean to imply that this is a miraculous record for a naked chain, or what?

A New Brake Pad.

NEITHER the reports of the last A.C.U. Six Days nor of Olympia noticed that a new brake pad has appeared on the horizon. Up-to-date motor cycle brake pads have been composed of fibre. I never heard any serious complaints of a good sample of this material, though every now and then one comes across a dud pad, which appears to be made of compressed blotting paper, and melts when it gets drenched. Car brakes are usually lined with asbestos reinforced with wire gauze. In the early part of this year the Ferodo laboratory got out a new "wireless" asbestos material, which they regard as superior to the old reinforced pattern. Many sample brake pads of the new stuff were tried out in this year's Six Days, and seemed to do quite as well as fibre. Olympia saw its Show *début*, and by this time next year we shall doubtless know whether it is better than the usual fibre pad.

A Misspent Holiday.

I BELIEVE theologians hold that there is a special department in Hell reserved for the writers of advertisements. It must be so. After the Show poor "Ixion" was looking a trifle spun, and his kindly Editor gave him a week off. I stood on a suburban platform and eyed the advertisements of holiday resorts. The first poster displayed a buxom damsel scantily swathed in a sort of *crêpe de chine* crank case, sitting on a sand castle in blazing sunshine, and administering bountiful glad eyes to the platform. Being a married man—and assisted by a below-zero draught from the east which howled across the station—I turned resolutely to the next poster. This exhibited maps of Cornwall and Italy carefully made to resemble each other. Between them stood a botanical curiosity in the shape of a tree, bearing apples on one side and oranges on the other. Against its trunk leant two damsels—one blonde, the other brunette. Beneath ran a legend to the effect that in climate, produce, and natural beauties Italy and Cornwall closely resemble each other. I hied me to Paddington, and took a ticket to Cornwall.

I no longer have any wish to see Italy. The temperature in Cornwall was below zero, and it snowed hard. There were no apples. The damsels in my selected watering place were extremely plain.

Heigh-ho!

Ixion's "MOTOR CYCLE REMINISCENCES" have just been published in book form, price 5s. 3d. post free, from "The Motor Cycle" Offices, 20, Tudor Street, E.C.4.

The Lucas Electric Hooter.

I WONDER how many owners of a Magdyno set are aware that the Lucas people market a nice electric horn to go with it, which can easily be connected up by any amateur in two minutes, and creates just the penetrating sort of noise required to shift a mirrorless char-à-banc over to its own side of the road. The price, of course, is steep compared to that of a bulb horn.

Pushbicycle Tail Lamps again.

LET me hastily preface that the Editor will not permit a resumption of the correspondence on this vexed question. I merely refer to it because one of the staff of the *New Statesman* has sent me a copy of that review for December 4th, in which a cyclist re-opens the campaign for the abolition of push-bicycle rear lamps, and is approved by the Editor. I thoroughly agree with the objection made to the manner in which this regulation has been reimposed by the Ministry of Transport on the rather dubious pretext of the railway strike, and without any Parliamentary discussion or support. That is exactly how we poor motorists are manhandled nowadays, and the experience may help the untaxed cyclist to sympathise with us. I further agree with the argument that "unlightable traffic" (*e.g.*, sheep) probably runs additional risks now that all "lightable" traffic is compelled to carry lamps. But I denounce the editorial comments that push-bicycle rear lamps are

(*a*) An intolerable burden

(*b*) Imposed solely to enable motorists to drive fast.

As a cyclist I know that a rear lamp is not an intolerable burden. As a motorist I know that rear lamps are a real protection to cyclists from cars which, so far from being driven fast, are being anxiously and gently steered by humane motorists under conditions of bad visibility. During the week-end of December 12th I had the misfortune to be out on a car in darkness and a thick snowfall, and found the cyclists' rear

Occasional Comments.—

lamps of vast assistance in driving home at an average speed of less than 10 m.p.h. The Editor of the *New Statesman* should know that wild exaggeration is not necessary in a good cause, and merely assists the disdisintegration of a bad cause.

Did Anybody Notice?

AMERICAN advertisers very seldom miss an opportunity, but the displayed announcement of Harley-Davidsons in our Show report issue left too much to the intelligence of readers. I will repeat its salient item here and now:

Model J, complete with electric lighting, horn, and speedometer	£199 10s.
Model F, complete with acetylene lighting, mechanical horn, and speedometer	£196 0s.

There are two very taking features in these price statements. The first is that you can buy a machine absolutely ready for the road, instead of having to ransack your local agent's stock for accessories which may or may not suit the layout of the machine. The second is that the complete electric equipment only adds £3 10s. to the cost, as compared with a complete non-electric equipment. At present British electric equipment costs more than this in most cases; and where such an equipment can be obtained at an infinitesimal cost addition, manufacturers do not trouble to make the fact plain to the world.

Narrowing the Issue.

I DO not happen to know what a private owner, resident in U.S.A., has to pay for the electric equipment fitted to the Harley if he purchases it separately for conversion purposes from the firm of electricians who supply it to the Harley people. But it is quite obvious that he would not have to pay anything like the sum a British electrical firm charges for such an outfit; otherwise the Harley people could not supply it as a 70s. extra upon gas lighting. An amateur friend of mine recently got an estimate from a leading firm of dynamo makers for fitting electric lighting to his 'bus. No structural alterations were needed, as his machine was easily adaptable, and did not require an extra drive; bolting on and wiring represented all the fitting required. The quotation was exactly £30. I mention this lest readers should imagine that motor cycle factories are profiteering, and charging additional percentages of a formidable character. This £30 set is the very make for which a certain motor cycle factory charges £24 15s. In other words, so far from profiteering, the motor cycle factory practically passes the lighting sets on to its customers at trade price, plus a very small charge for fitting. I do not even say that the dynamo firms are profiteering. No doubt their sets are of better quality than the American sets. No doubt their labour is more expensive, and possibly less industrious. The outstanding facts are that the American sets are of very decent quality, and that our price is very far from being competitive. Before long the Germans will doubtless assault this market, and they will have an enormous advantage in the low value of the mark, as the magneto industry has already realised. The German may even be able to supply magneto-dynamo outfits at a lower cost than we can supply ordinary magnetos, so that a machine with British gas lamps and a British magneto may be listed at *five pounds more* than the same machine with a German dymag.

I am sorry to draw attention to such doleful possibilities, but forewarned is forearmed. Patent rights may alleviate the position temporarily, but I doubt whether anything approaching an undodgable master patent is possible in this sphere.

Jack frost or, more correctly, his brother hoar frost, performs some marvellous transformations to the countryside. It may be cold, but it is worth it.

Should We Follow Car Practice?

Observations Suggested by, rather than Replying to, the Conclusions of "Criticus."

IN *The Motor Cycle* of December 16th an article on car practice in motor cycle design appeared under the signature of "Criticus," and the conclusions on which the writer bases his opinions seem to call for qualification.

These remarks, therefore, must be taken in their general sense, since they are only directed against the contentions of the above-mentioned writer to the extent that his reflections are assumed to be the mass-opinion of the car using community. At the outset we must recollect that the modern motor cycle preceded the car (assuming modern internal combustion-engined vehicles to date from Gottlieb Daimler's first effort), and that for many years cycle and car design went hand-in-hand. With increase of engine and transmission efficiency, however, the ideals of the car world led to a divergence coincident with the realisation that the car, as such, was a vehicle needing special features not then within the purview of cycle practice; many of those features are still outside the essential needs of the motor cycle, which it is to be hoped will remain true to type and not be contorted into that terrible thing which may be foisted upon us by zealots, the "car on two wheels"—a growth prone to sporadic outbursts in the U.S.A.!

Save Us from our Friends!

Thus car owners of the "Criticus" school look with dismay on our power units, apparently naked and exposed, and then urge a wider adoption of outside flywheels on motor cycles because that is following car practice. Now let us examine this very matter. Mechanically (in the case of single or V twin engines) inside flywheels have many advantages, commercially they make a cheaper unit, while practically the facilities which they permit in the direction of enclosing moving parts and transmission are undeniable. Commentary on this question is really needless in view of the tendency towards the enclosing of outside flywheels in special covers. (Shall we have to invent a new definition for "inside-outside" or "outside-inside" flywheels?)

In the matter of brakes it is doubtful whether the belt-drum type is to be roundly condemned; it may appal the car-owner, but there is no obligation on the part of the motor cycle designer to please the four-wheel enthusiast. The belt-drum brake fulfils the essential requirement of motor cycle practice; it is light, cheap, unaffected by weather, simple to adjust, and is powerful as well as smooth.

Easy-changing Gears.

"Criticus" asserts that we are adopting sliding gears, but bemoans the fact that we have a pull on the score of easy gear manipulation. Now the sliding gear is not nearly so common in motor cycles as the constant mesh type, and it is to the latter, in conjunction with the various excellent "delayed action" control mechanisms now used, that the motor cycle owes its easy changing facilities.

In the lubrication of motor cycle engines there appears to be no need for a slavish following of car practice, since the problems involved are in most cases of an entirely different nature. Car engines mostly have plain bearings which demand careful lubrication; motor cycles, on the other hand, are largely equipped with ball and roller bearings, and may be run efficiently on a splash lubrication system with a supply controlled by crank-case suction or exhaust-operated depression. Ball or roller bearing engines require a minimum of oil, and, provided the pistons are correctly lubricated, the bearings should take care of themselves. I firmly believe that motor cycle engines are consistently and negligently over-oiled; my own machine, a 532 c.c. twin with roller bearings to big ends and cranks, has done 1,200 m.p.g. of oil (sidecar) regularly, and I believe this could have been cut down.

"A Red Herring."

Finally, we are subjected to the inevitable ton-miles per gallon criticism. Let it be said at once that the car beats the motor cycle on this point only as the lorry beats the car. Carburetter tests have proved that a certain minimum consumption exists for a given idling engine, and that the consumption accounts for the great part of the same engine's fuel demand under full load, *i.e.*, an idling engine is not conducive to favourable consumption-to-load ratio. The motor cycle by reason of its high power-to-load ratio runs largely with idling engine, and its consumption approaches an irreducible minimum. A laden lorry, with low power-to-weight ratio, runs economically on a ton-miles per gallon basis, but it cannot be recommended as a "cheap" vehicle to run.

The reason motor cycle two-lever carburetters still persist is because of that same need which calls into being the wonderfully named and priced "petrol economisers" (extra air inlets) largely offered to car users as adjuncts to their automatic carburetters.

Specialised Needs—Specialised Methods.

Because certain details in car practice are used in motor cycle construction and *vice versa*, owing to contemporary growth and similarity of service, it does not follow that the one must necessarily follow the other in any particular direction; to ask for further unification of ideals merely for the sake of uniformity is futile. Nothing in either sphere is permissible unless it can be referred to a definite, useful, and purposeful end. Let each type proceed along its own lines, having regard rather to the complexity of its own problems than to the wholesale adoption of ideas developed in other fields.

WHARFEDALE.

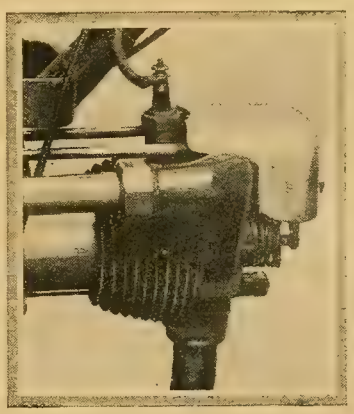
THE 3½ h.p. FLAT TWIN BROUGH.

A Comfortable and Speedy Sporting Machine.

MANY machines are fast: many machines are comfortable: some are fast and comfortable: a few are fast and comfortable *simultaneously*: but very few mediumweights come under this category. The new 3½ h.p. sporting Brough is one of the very few. Or, more explicitly, the Brough may be driven at really high speeds over really bad roads with little appreciable effect on machine or rider.

For nearly ten years Messrs. W. E. Brough have produced flat twins with a distinctly sporting flavour; and the machine that we recently rode away from Nottingham bears evidence of this in every line. Although not identical in every respect with their 1921 model, the main features are the same. It is an entirely new design, and has a 496 c.c. flat twin engine with overhead valves and detachable cylinder heads. A speed of 60 m.p.h. is guaranteed, which, for a three-speed countershaft machine with touring equipment, is an excellent figure.

Not on our test mount, but included in the final design is a large internal-expanding Ferodo-lined front brake, also a special Amac carburetter that bolts directly on to the timing cover, which contains the cored gas passages.



Showing the neat cover for the overhead valve rockers, which are internally lubricated through hollow operating rods.

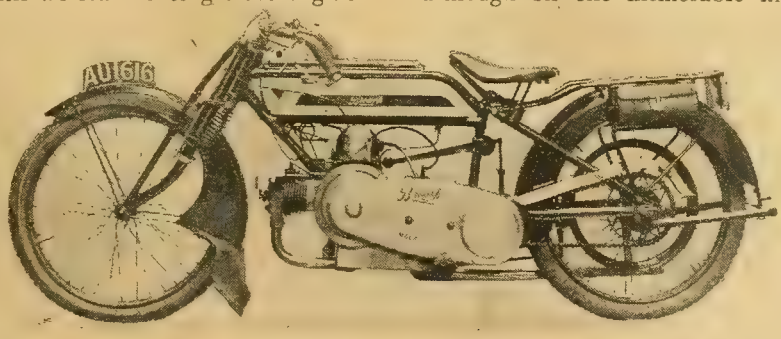
We may now mention our only difficulty with this particular mount. Until we learned to get the engine really "revving" on second gear before engaging the rather high top ratio, we found a slight but distinct tendency to "pull up" when accelerating. The deeper float chamber and shorter manifold of the new carburetter, however, should remedy this. And, even so, the get-away, after short experience, is as rapid as any who consider their tyres could desire.

Speeds that are Deceptive.

Once under way the speed, on account of the remarkable degree of comfort, becomes deceptive, and only with streaming eyes and a "scraped" corner comes the realisation that we have been doing forty-five on a road where we had previously never exceeded thirty-five. It must not be inferred from this bit of lurid corner work that the steering is difficult. Naturally, an outsize in wheelbases makes the Brough a different proposition from the usual T.T. machine to pilot round a "hair-pin"; but, again, *experientia docet*, and, having learned—well, the cycle almost steers itself.

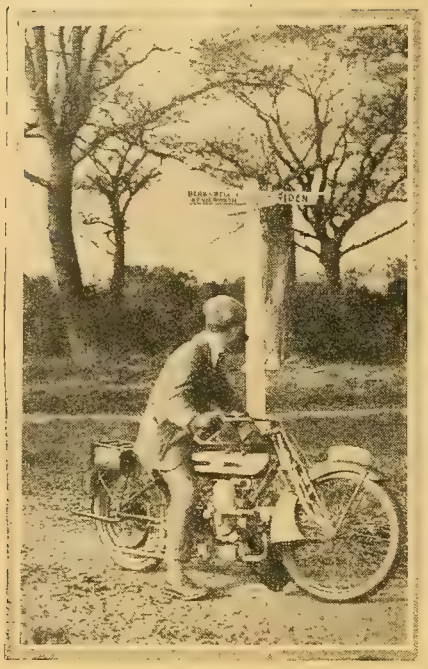
That notorious "snag" of the flat twin, difficulty of lubrication, appears to have been very effectively overcome. We set the automatic feed at an extravagant opening, and, although on one memorable night ride, lost among strange and slimy byways, we covered more than ten miles in second gear, with a following wind that every now and then obscured our path with dense exhaust smoke, we never had occasion to remove a plug.

Specially pleasing to the critical ear is the exhaust note, well silenced,



Typically sporting lines are not sacrificed, although the mudguarding is of "all weather" dimensions. The sharply dropped handle-bars were found to be most comfortable.

Road Tests of New Models.—



Autumn leaves are not an ideal road surface; however, the Brough is very steady on most varieties of slime. A cross-roads direction query.

but with just that hint of a "crackle" that indicates latent power awaiting a favourable opportunity of making itself felt. Indeed, the machine "feels" like a big twin in its general proportions; a "long" engine and tank of large size make it difficult to believe that the capacity of the power unit is but that of a 3½ h.p. single; and there was nothing in the Brough's performance that tended to emphasise the limitations expected of the 500 c.c. engine.

Mudguarding for a sporting type of mount is unusually complete, a large flap at the lower end of the front guard proving most effective without, on account of its diagonal setting and flexible construction, materially affecting wind resistance. The rear guard, too, proved an excellent protection on some very muddy journeys. A simple shield serves to protect the rear chain, but the primary drive is enclosed in a large aluminium cover. Both are quickly detachable.

The exposed position of the valves keeps them efficiently cooled, and their lubrication is effected through hollow operating rods.

Thus a specification essentially intended for speed actually combines the reliability and strength of a hefty single with the smoothness and comfort of a spring frame twin. And how it attains this latter end without any form of frame springing presents a nice little problem for the theorists. Several factors contribute—the even torque of a well-balanced engine, a silky cush drive, a long wheelbase, large tyres (kept fairly soft), a comfortable riding position in conjunction with an excellent saddle (Brooks B 176) are, probably in the order we have given them, chiefly responsible.

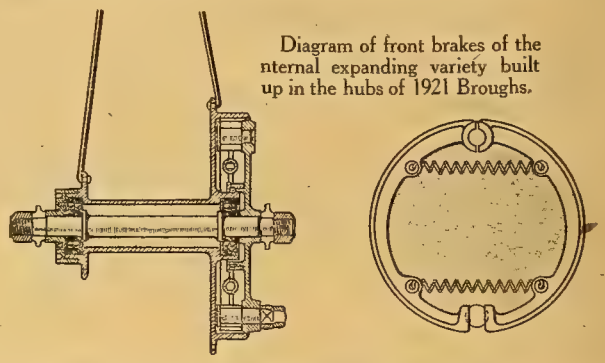


Diagram of front brakes of the nternal expanding variety built up in the hubs of 1921 Broughs.

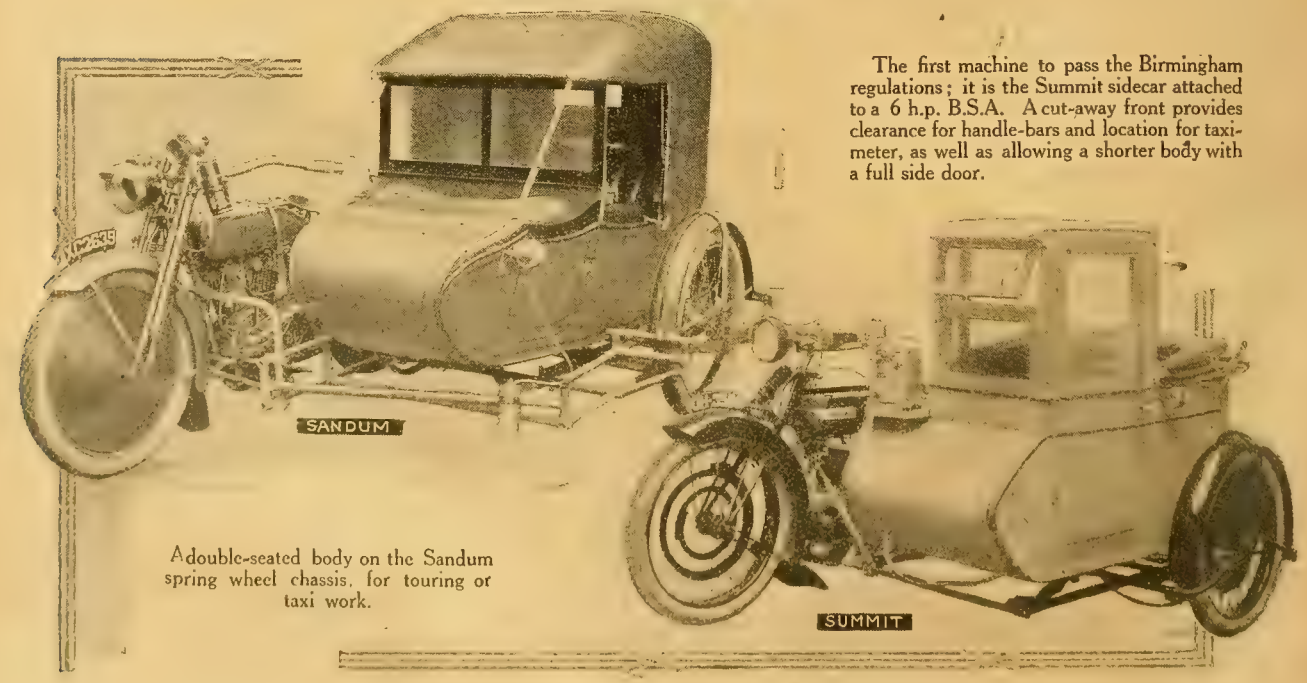
But theorising, fortunately, does not alter the fact that the latest Brough *is* comfortable. It is that rare type of machine that on account of its diverse qualities should appeal alike to clubman and tourist.

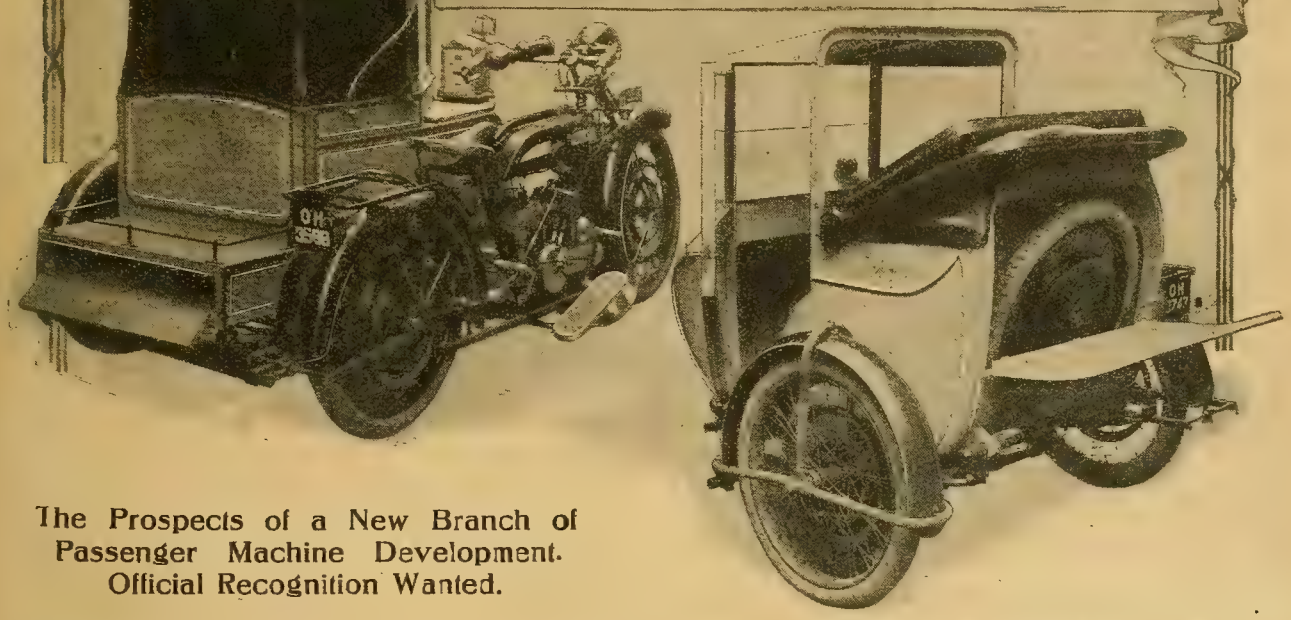
SIDECAR TAXI-CABS.—A comprehensive article on this type of vehicle, together with the views of fifteen police authorities, appears on page 863.



The first machine to pass the Birmingham regulations; it is the Summit sidecar attached to a 6 h.p. B.S.A. A cut-away front provides clearance for handle-bars and location for taximeter, as well as allowing a shorter body with a full side door.

A double-seated body on the Sandum spring wheel chassis, for touring or taxi work.

The Taxi-Sidecar



Summit (left) and Canoelet (right) methods of spare wheel and luggage carrying arrangements.

The Prospects of a New Branch of Passenger Machine Development. Official Recognition Wanted.

A NEW phase of sidecar progress has recently made itself evident, and but for lack of official support in some quarters it would no doubt be having a far reaching influence upon the commercial prosperity of certain sections of the motor cycle trade.

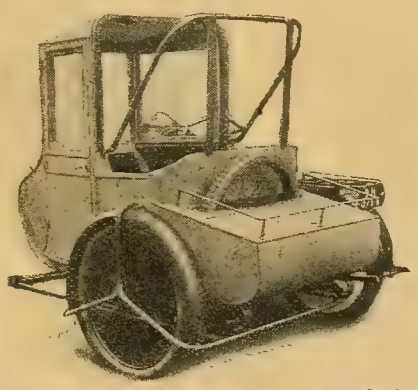
We refer, of course, to the many sidecar taxi-cabs which are now undergoing tests in the hands of various sidecar and motor cycle manufacturers. These were quite a feature of the Olympia Show, where at least eight machines of this type were shown.

A Hampered Movement.

Conversing at Olympia with makers of this type of vehicle we found that orders might have been freely booked, given the immediate possibility of obtaining hackney carriage licences for the sidecar taxi, but so far (with only a few exceptions) the official mind has exhibited its usual apathy towards all things connected with the motor cycle movement. By the second day of the Show, for instance, one firm alone had booked orders for thirty complete taxi-cab outfits conditional upon official sanction for their use being obtained.

Economical Running.

The outstanding claim for the motor cycle taxi, as against the ordinary four-wheeled vehicle, is its economical running. This will permit a great reduction in the fares charged to the public for the same class of service which has hitherto been available, for even at the present prices of supplies it is confidently assumed that a 6 or 8 h.p. outfit with a double-seated enclosed body may be run at a charge to the passenger of 6d. per mile. While this figure may be slightly optimistic there is no reason why such a machine should not be run profitably for 8d. a mile, which represents a saving of 33⅓% over the existing taxi-cab fares in London. Apart from this actual economy there should also be a saving in other directions. In traffic, for instance, the sidecar is much faster than the four-wheeled car owing to its smaller bulk, its rapid acceleration, and its great mobility. In this latter direction, of course no four-wheeled vehicle can compare with it, since the motor cycle and sidecar will turn in its own length with the greatest ease; it thus has the advantage under circumstances where the ordinary taxi-cab would have to make use of its reverse.



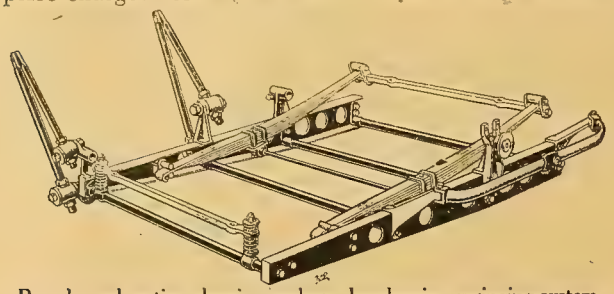
Watsonian taxi with well for spare wheel behind seats; the hood material is removed from sticks in order to show the interior. Note the large luggage grid and boot at the rear of the body.

Why is Encouragement Withheld?

Up to the present no definite reasons have been forthcoming as to the reason for the official refusals to grant licences. So far as can be seen, almost all the machines which were exhibited at Olympia comply with the requirements which were framed in the first case for four-wheelers, and it is feared that a good deal of the disinclination to consider the claims of the smaller and lighter vehicle arises from a desire to placate existing interests. If this is so, the situation is unfortunate, and it may take some considerable time before anything can be done. Nevertheless, even those who already own or drive taxi-cabs should be brought to realise that the sidecar has advantages which will appeal to all. The cost of running and the initial cost are proportion-

The Taxi-sidecar.—

ately less, in much the same ratio as the takings would be less than present receipts; therefore the profits on the business should be the same with less outlay and responsibility. The fact also that a machine can be hired at a much more reasonable charge would no doubt result in an increase of business, since the general public, especially business men and others to whom speedy transport is important, would not hesitate to charter the sidecar taxi, simply because the low price charged for its hire would not deter the economically minded. To those requiring a machine for several hours the question of low charges would have a special attraction.



Rex channel section chassis members also showing springing system.

The Required Specification.

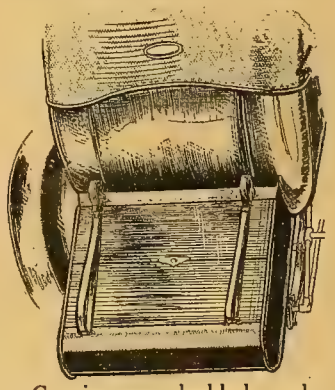
Turning to the actual details of such a vehicle it is unfortunate that there are no uniform regulations existing throughout the country, probably the majority of city councils pass their byelaws on the Scotland Yard requirements, but this does not always appear to be the case, and consequently a machine which is suitable for one town might require some modifications in another. At the same time it is believed that if one or two of our largest cities, such as London, Newcastle, or Manchester, would give a lead, the others would accept machines conforming to the specifications passed by them. It may be assumed, of course, that the following details will be needed in every case. Dealing with the machine in the first case, this must be of from 6 to 8 h.p. with gearing which will enable it to make a standing start with full load on a gradient of about 1 in 6 or 1 in 8; it must be capable of turning within a 15ft. circle, it must have two brakes, each one capable of bringing the machine to a standstill in a reasonable distance; and it must have detachable wheels, interchangeable with that of the sidecar, and a spare wheel must be carried. Electric lighting would be desirable, but in any case a light will be needed for the taximeter itself in addition to the normal lighting equipment required by law for all such vehicles. The sidecar will have to be capable of taking two adult passengers (a minimum width for the seating being usually specified). The body itself must be capable of being fully enclosed so as to be weatherproof, and the door must not be less than a specified width, with perfectly straight sides; the height of the hood must be such as not to prevent the driver from looking directly to his left when normally seated. The taximeter must be so placed that it can be clearly seen by the passenger, and it must be illuminated at night. In addition to all this, there must be reasonable luggage carrying capacity.

Present Position.

These requirements are by no means easy to fulfil, at the same time keeping the size and width of the outfit within reasonable limits, but an inspection of the various machines which are now available shows that in most cases the designers have met all these stipulations in a very satisfactory way.

Each manufacturer interested is doing his utmost to bring the claims of his particular machine before the notice of the licensing authorities, but, as before stated, little interest appears to be taken, if we except Nottingham, where the sidecar taxi was accepted some time ago conditionally upon its being run by ex-service men, and Birmingham, where at least one sidecar taxi is in commission. Bradford (Yorks.) and Guildford (Surrey) appear to be favourably disposed, while other places have the matter under consideration.

No doubt before anything can be done a wide appeal must be made, and the general public must make it known that there is a desire for this cheaper type of transport in our cities; business men who would largely appreciate the institution of sidecar taxi services could do much by bringing the matter before local Chambers of Commerce and similar bodies. Meanwhile the practical proof of the sidecar taxi outfit might be demonstrated by the inauguration of fleets available for private hire. If this is done, it can only be a matter of a little time before the hackney carriage regulations are modified, and the sidecar taxi accepted for universal use.



Campion spare wheel locker and luggage platform.

TAXI SIDECARS AND THE POLICE AUTHORITIES.

In order to ascertain the views of local authorities concerning sdecar taxis, we approached the chief constables of several cities, but their opinions are by no means unanimous. The taxi-sidecar is new, and before long may be generally recognised.

Sir,—In answer to your letter of the 13th inst., I have to inform you that the question of licensing motor cycles with sidecars has been before the Hackney Carriage, etc., Sub-committee on two occasions, but no decision has been arrived at, there not having been any applications before them.

F. CALDWELL,
Chief Constable, Liverpool.

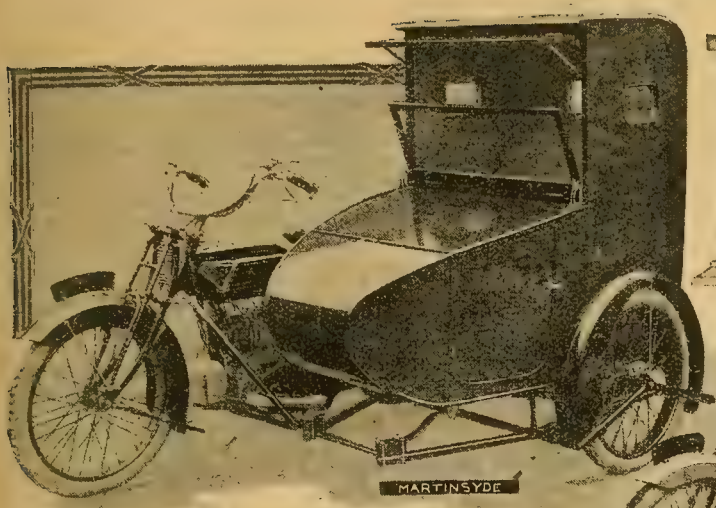
Sir,—Replying to your letter of the 13th inst., addressed to the Chief Constable, I beg to inform you that my Council has granted licences in respect of two motor cycles and sidecars to ply for public hire in the borough. A third licence was applied for by the same firm, but the Licensing Committee was not prepared to entertain any further similar applications for the present.

The Committee has not laid down any special specification in regard to such machines.

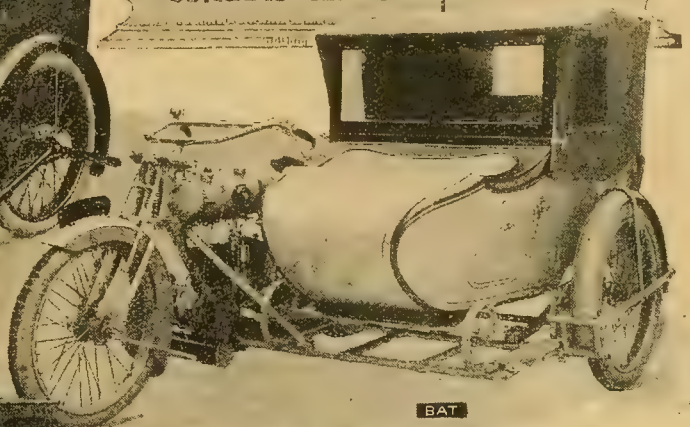
The two motor cycles in question are the design of the proprietors, who are two ex-Service officers, and the sidecars contain accommodation for two passengers.

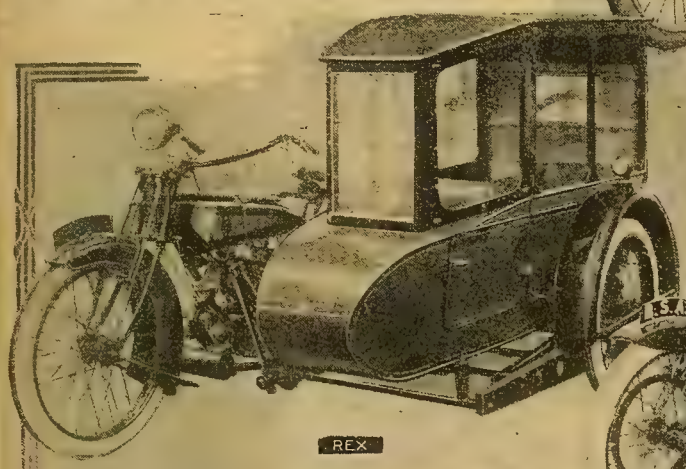
FREDK. S. HEX,
Town Clerk, Torquay.

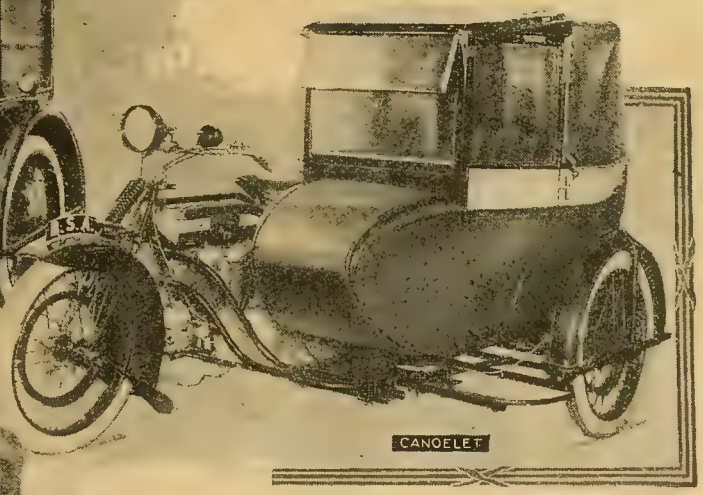
Examples of Two-Seater Sidecars designed primarily for taxi-service but suitable also for private use

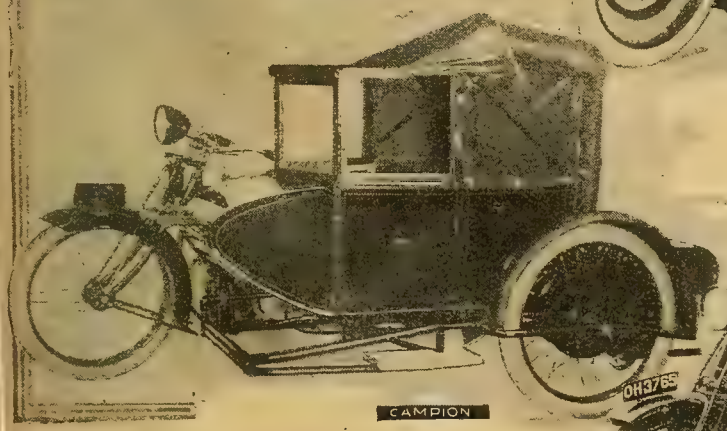


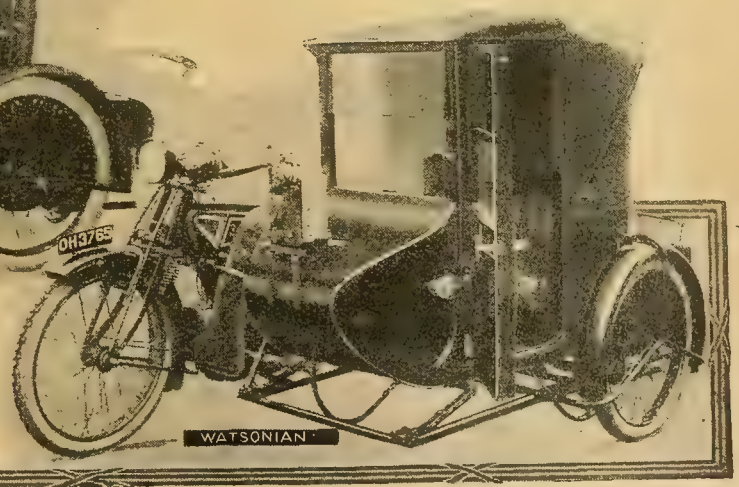
The Martinsyde body somewhat follows "hansom" lines, while the Bat has a hinged dash and Cape hood.











Rex taxi bodies have staggered seats and a permanent roof with detachable flexible "lights." Canoelet upper work is on convention cabriolet or taxi-cab lines. The Campion has a fixed screen with hood and side curtains, while the Watsonian is another follower of true taxi-cab body design.

The Taxi-sidecar.—

Sir,—Up to the present no application has been made to the Watch Committee for the licensing of a sidecar taxi in this borough. H. M. Haywood,
Chief Constable, Derby.

Sir,—The licensing of motor cycles with sidecar outfits as hackney carriages is under consideration here, but no decision has yet been arrived at.
J. B. Wright,
Chief Constable, Newcastle-on-Tync.

Sir,—I have to acknowledge receipt of your letter of the 13th inst. respecting the use of motor cycles with sidecars as hackney carriages, and to acquaint you that the Police Authority of this city has received a few applications for the licensing of these vehicles. It was, however, found by the applicants that the venture was not a financial success, and they ceased to use the vehicles for the purpose licensed. James A. Wilson,
Chief Constable, Cardiff.

Birmingham is Progressive.

Sir,—I have to inform you that the Watch Committee of the City of Birmingham, at its meeting held on the 6th October, decided to license cycle cabs to ply for hire, provided that the vehicles pass the necessary tests by the hackney carriage experts.
J. D. Griffiths,
Chief Inspector, Birmingham.

The Birmingham City Police has printed rules and regulations with respect to the licensing of motor sidecar taxicabs, from which the following are extracts:

"Motor cycle taxicabs must be new, and submitted for inspection in a thoroughly good condition, and no vehicle will be licensed unless it is certified by the experts appointed by the Watch Committee to be safe and fit for public use as a motor cycle taxicab.

"There must be at least four connections, of approved design, connecting the sidecar to the cycle.

"The cycle must be fitted with a countershaft gear box, and geared not higher than 5¼ to 1 or 5 to 1.

"All driving chains and sprockets must be protected by suitable guard.

"The tyres shall not be less than 700×80 mm.

"A spare interchangeable wheel, of approved pattern, must be carried.

"The sidecar must be of the landaulet or coupé type, and fitted with an adjustable hood that can be lowered.

"Measurements.

"Width on seat rail (inside of lining) ...	32in.
Top of cushion to floor	9in.
Top of cushion to roof	36in.
Cushion from front to back not less than ...	18in.
Door	18in.

"The body must be so fitted as to enable the driver to see over the sidecar. Adequate accommodation to enable each passenger to sit with ease must be provided.

"Ground clearance shall not be less than 5½in.

"Drop windows and doors must be constructed, so that they may be readily opened by passenger from the inside.

"Suitable steps must be provided.

"The windscreen and door lights are to be of Triplex Safety glass, or other glass that will not splinter, or of some non-inflammable material.

"A fire extinguisher, of approved type, must be provided and carried on each taxicab."

Under Consideration.

Sir,—I have to inform you that an application has already been made to run sidecar taxis in this city, and the matter is now under consideration. H. Allen,
Chief Constable, Leicester.

Sir,—There has been only one application made for a motor cycle and sidecar to be licensed as a hackney carriage, and it has been granted. There is no specification as to the suitability of the machine at present, but requirements are in course of preparation.
Josh. Farndale,
Chief Constable, Bradford.

Sir,—I am in receipt of your letter dated the 13th inst. respecting taxi sidecars, and have to inform you that I have brought the matter to the notice of the Watch Committee, who are the Hackney Carriage Licensing Department, but they do not anticipate adopting the use of the vehicles in question at the present juncture.
D. Webster,
Chief Constable, Wolverhampton.

Coventry's Requirements.

Sir,—(1.) I am willing to consider applications for the licensing of sidecar outfits to ply for hire on taxicab service.

(2.) Briefly, the cycle should be twin-cylinder-engined, from 6 to 8 h.p., free from vibration, and with a clean exhaust, and be capable of easy handling in congested traffic.

The sidecar should afford ample seating room for two persons, not necessarily side by side, fitted with hood and side protective screens.

The windscreens should be of "non-flam." celluloid or three-ply glass.

When the hood and screens are up both passengers should be able without difficulty to get into the sidecar.

There should be an efficient luggage carrier, and a spare wheel should be carried which will fit either of the wheels of the cycle or the sidecar, and be capable of being changed within a reasonably short time.

I have had one application, but neither the cycle nor the sidecar was suitable for such work.

(3.) Two manufacturers have shown me machines.

Both cycles were suitable, but the sidecars I have seen have not been quite what I should like.
Wm. Imber,
Chief Constable, Coventry.

Sir,—This matter is at present receiving the consideration of the Watch Committee.
F. J. Lemon (Lt.-Col.),
Chief Constable, Leeds.

Three Negatives.

Sir,—At a meeting on the 2nd inst. the Watch Committee of this city fully considered the matter of licensing motor cycles and sidecars as hackney carriages in Sheffield, when three applications were submitted, and it was decided that such vehicles should *not* be licensed to ply for hire as hackney carriages in this city.
J. Hall Dalwood (Lt.-Col.),
Chief Constable, Sheffield.

Sir,—I have to say that the Hackney Coach Committee has had under consideration the question of licensing motor cycles with sidecars for taxicab purposes, but has come to the conclusion that vehicles of this kind are not suitable for city work. R. Peacock,
Chief Constable, Manchester.

Sir,—So far no applications for the licensing of motor cycle and sidecar outfits as public hackney carriages have been received by me, neither am I willing to consider such applications. J. H. Watson,
Chief Constable, Bristol.

Nottingham Taxi Sidecars.

Sir,—I beg to inform you that on June 14th last my Watch Committee granted three licences for cycles and sidecars to ply for hire as taxi cycles, provided they were worked by ex-service men only. They are under the same regulations as for taxicabs.

The machines are 6 h.p. Campions, and the sidecars are built to carry two passengers.

The fares charged are 1s. for the first mile, and 8d. for each succeeding mile, with a proportion charge of 8d. for each succeeding proportionate part of a mile.

There is a taximeter fitted on the front of each sidecar in order that the passengers can read the distance they have travelled and the amount of fare due.

These cycles are giving every satisfaction to the public.
F. Brook (Lt.-Col.),
Chief Constable, Nottingham.

Current Chat

Compliments of the Season.

The Editor and Staff of *The Motor Cycle* wish every reader a Happy New Year.

Car Practice.

Should we follow car practice? This point is discussed in an article on page 860.

Get Ready for Spring.

The present is a very favourable time, from the quick delivery viewpoint, for overhauls and renovations by the makers.

Oversize Tyres.

Tyres of a larger section than that standardised by the makers are becoming more popular every day. It must be remembered that the fitting of such tyres automatically raises the gear, although, strictly speaking, the numerical ratio remains unaltered.

Those Licence Card Holders.

A correspondent points out that licence card holders of apparently the same specification are offered to the public at prices ranging from 2s. to 10s. He demands an answer to the rather obvious why?

E.E.F. D.R.'s Reunion Dinner.

It is desired that as many as possible late D.R.'s of the Desert Mounted Corps E.E.F. attend the second reunion dinner on February 5th, 1921. Will all those not notified at the previous one, owing to the lack of addresses, please communicate with either of the following: Mr. J. G. King, 100, Bedford Road, Kempston, Beds., or Mr. D. R. Andrews, 90, Deansgate, Manchester?

Standardisation of the Foot Brake.

Last week we commented on an incidental objection to standardising the rear brake pedal on the right of the machine, as recommended by the A.C.U. Committee, viz., the difficulty of operating the kick-starter pedal simultaneously with the brake after a stop on an up gradient. Another point more inherent than incidental is the fact that thousands of machines are fitted with a brake acting on the belt rim, which is invariably on the left. Obviously, to take the pedal to the right in this case complicates and weakens the whole operating mechanism.

While You Wait.

To meet the convenience of motor cyclists desirous of becoming members of the A.A. whilst on the road, the road patrols have been authorised to enrol new members.

Wanted.

Owners of ex-W.D. machines, or rather of machines with W.D. type flat handlebars, are looking for a licence holder *that swivels*. Otherwise they will almost be confined to the number plate position.

Justice!

Last week a Bristol magistrate, in fining several motor cyclists for not having their machines properly lighted, inferred that a fine is heavier when a man attempted to save a day's wages by not appearing. In safeguarding his employment a man is therefore penalised.

Special Features.

SHOULD WE FOLLOW CAR PRACTICE?

THE TAXI-SIDECAR.

RENOVATING AN ILL-USED MORGAN.

Rumours.

It has been said that the author of "Home, sweet home" was an unsuccessful competitor in an early London-Exeter run. [When they went by coaches perhaps.—ED.]

The "Old George" at Norton St. Philip.

Illustrative of the keenness of our readers, several have pointed out that Norton St. Philip is in Somerset, and not in Wiltshire, as stated in *The Motor Cycle* of Dec. 16th. Incidentally, one correspondent recalls the interesting fact that the old George Inn under discussion was the resting place of Monmouth when marching *viâ* Frome to his last renowned, if disastrous, battle.

American motor cyclists have much colder weather to contend with than their British contemporaries, yet sidecar hoods and screens have not yet found favour. However, the passenger in this *National* sidecar appears comfortable enough, while the driver's "coon" coat is reminiscent of the early days of motoring in this country—a smart turnout nevertheless.

1921 Costs.

Petrol down—taxes up—but the motor cyclist who covers big annual mileages is all to the good.

Endorsements in the Future.

For the third time the Roads Bill was read and passed by the House of Lords on Tuesday of last week. An important amendment was agreed to, on the motion of the Earl of Lytton, providing that, if the owner of an endorsed licence has, for a period of three years, no offence recorded against him, he shall be entitled to a clean licence.

The High Cost of Living.

What with increased taxation, increased insurance rates, increased subscriptions to motoring organisations, licence card holders, etc., we are inclined to agree with the motor cyclist who thought of selling his machine in order to be able to afford these necessities—but has not.

THE MOTOR CYCLE

4d.

On and after the issue of January 13th, 1921, the price of "The Motor Cycle" will be 4d. instead of 4½d. as hitherto.

A small reduction in the cost of paper enables us to effect this slight change. We regret we are unable at present to lower the price to 3d., but the vast circulation (over 100,000 net) makes this impossible at the present cost of labour and material.

A further reduction in price will be made as soon as circumstances allow.

ILIFFE & SONS LTD.

An A.C.U. Innovation.

The A.C.U. are inaugurating a tennis club for 1921. We may shortly expect inter-centre matches, but there is no truth in the rumour that a tie for the team prize in the 1921 Six Days Trials will be decided by the "racket." In the last "Six Days" a maximum of only five marks could be lost under this heading.

Multi Plugs Increase Power.

Mr. G. H. Lanchester presided on Tuesday of last week at a Graduates' Section (Coventry) meeting of the Institution of Automobile Engineers. Mr. A. Hayward read a short paper on "Combustion" before fifty-two members, graduates, and visitors at the Foremen's Institute, Coventry.

Mr. A. P. Young, the magneto expert, commented upon some points raised in the paper, and stated that, in his opinion, turbulence in the combustion chamber increased the speed of pressure rise in the ratio of about 8 to 1 compared with the quiescent mixture. Referring to the advantages derived from the use of more than one plug, he instanced a test where a considerable increase in power was effected by the use of four plugs. The reduction of horse-power in an engine fitted with two plugs, with only one in use, was about 5%.

Reduction in Price.

On and after Thursday, January 13th, *The Motor Cycle* will cost you 4d. only.

Ultra Lightweights.

In next year's Six Days Trials a class replete with their new licences and holders on New Year's Day?

Next Year.

How many will appear on the road replete with their new licences and holders on New Year's Day?

London-Exeter-London.

There were 173 motor cycle and runabout entrants for last Monday and Tuesday's classic run to Exeter and back.

On Duty.

As we go to press the purr of a Scott and the distinctive note of a single from "down below" remind us that two of the staff have departed to see the London-Exeter Trial.

Re Keeping Ears Warm.

Despite a somewhat lamentable association with the super-knut, there is no doubt that fur-lined helmets are *the* cold weather headgear. Loss of dignity is preferable to frost-bitten ears!

Sidecar or Solo.

Although the confirmed sidecarist often dreads solo work on greasy roads, the true soloist is perfectly happy, and, strange to say, seldom skids, which proves that skidding is generally caused by lack of confidence.

New Models (?).

One would expect a printer's journal to be fairly free from compositors' errors; yet a recent issue of the *Printers' Exchange* contained a notice of "Pageot" and "Inadrant" motor cycles in an auction sale.

The Institution of Automobile Engineers.

The annual dinner and social evening of the I.A.E. graduates will be held on Saturday, 5th February, 1921. Tickets (single 15/-, double 21/-) may now be obtained from the hon. secretary, Mr. D. J. Macklin, 54, Malden Road, Acton, W.3. As the number is limited, early application is advisable.

The Price of Petrol in 1921.

Our readers will naturally rejoice at the fact that the price of petrol will be reduced by sevenpence a gallon as from January 1st. This is on account of the withdrawal of the petrol tax of sixpence on every gallon of spirit sold, and an extra penny the companies have been wont to charge for the expense of collecting it.

As to what the future price of petrol will be it is very hard to say. People have feared that as soon as the tax came off the price would go up, but, fortunately, this rumour seems to have no foundation. In fact, it has been suggested that the price may go down. While we sincerely hope that this will be the case, the controlling factor—the price of petrol in the U.S.A.—appears to be more or less stabilised at the present time, and no material change is yet indicated.

Notes on 1921 Taxation

TO THOSE WHO NOW OWN MOTOR CYCLES

Your new licence, which includes taxation, must be paid before January 31st.

This month's grace only applies to the first month of the working of the new Act.

TO THOSE WHO TAKE DELIVERY OF A NEW MOTOR CYCLE.

A licence, which will include numbers, must be taken out before the machine can be used.

The tax and licence will be:

- **5/-** for motor-propelled machines for invalids.
- **30/-** for a solo motor cycle under 200 lb.
- **50/-** for a sidecar outfit, the motor cycle of which is under 200 lb.
- **60/-** for a solo motor cycle over 200 lb.
- **80/-** for a sidecar outfit, the motor cycle of which is over 200 lb.
- **80/-** for a three-wheeled cycle car under 8 cwt.

The weights mentioned are unladen weights, *i.e.*, without petrol, oil, and equipment, which is not actually necessary for the machine to run on the road.

The licence card is square or circular, and must be carried on the machine in a water-tight holder in such a position that it may be seen from the near side of the machine in the daytime.

With a first licence for a machine the owner will be given a registration book, which is intended to be a record of the machine's life.

The new licence includes registration and taxation, but does not include the driving licence, which remains as before—5s. per annum.

If a machine is licensed as a solo mount, and it is decided to fit a sidecar, the owner must take out a fresh licence and hand in the one existing, paying the balance of 20s.

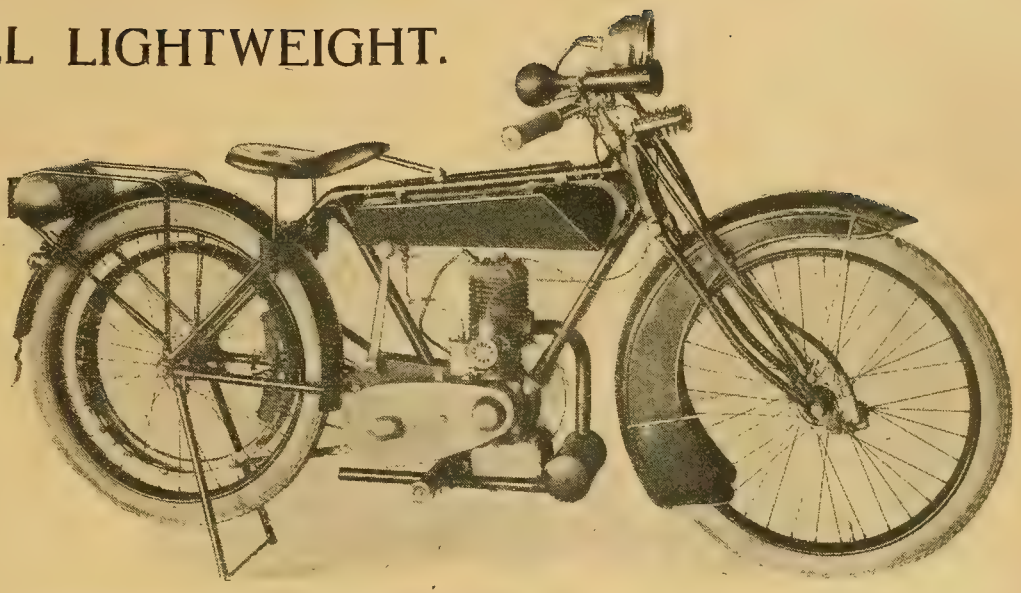
Taxation in future goes with the machine. The buyer of a second-hand motor cycle should see that the licence card is on the machine. He must sign the seller's registration book, and must see that the seller also signs as the "old" owner, who will then post it to the authorities with whom the licence was taken out.

DO NOT WAIT UNTIL THE 31st OF JANUARY!

A NOVEL LIGHTWEIGHT.

A Two-speed, Two-stroke, with Magneto Flywheel and Lighting Set for £60.

IT is quite refreshing to find a two-stroke which embodies several novel features. This, however, is the case with the 2¾ h.p. Hawker, a lightweight motor cycle intended for mass production and to be sold to the public at the low figure of £60. It will shortly be marketed by the H. G. Hawker Engineering Co., Ltd., Kingston-on-Thames, Mr. H. G. Hawker and Mr. T. O. M. Sopwith being the best known members of the company's board responsible for its production.



Produced under one roof, the new Hawker lightweight has more than the usual number of interesting points. Observe the rear top tube lug.

The ideas followed in building the Hawker have been cheapness of production, solidity, simplicity, and of course low weight, and we are assured that, without any special effort being made to obtain supreme lightness, the machine weighs but 165 lb., including all accessories and fuel.

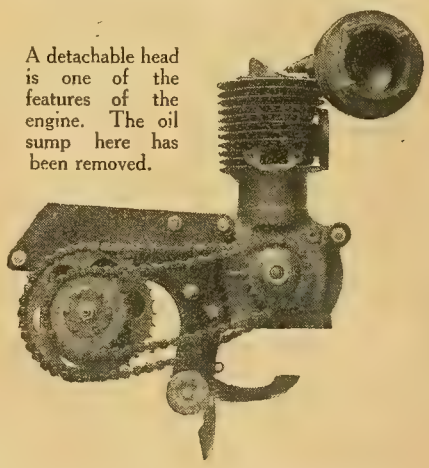
Accessibility.

The engine has a bore and stroke of 70×76 mm. (292 c.c.). Several novel features are incorporated in its design. The crank case and cylinder are in one casting, but on the flywheel side of the engine is a long main bearing which is supported in a circular disc, the removal of which gives access to the crank chamber and enables the crankshaft to be inserted. The engine is of the three-port variety, but experiments have been made in port construction, and it has been found that the V-shaped induction port gives better suction and renders the engine less liable to four-stroke. Another interesting feature is the casting of the transfer port in one with the cylinder, no separate cover to this being employed.

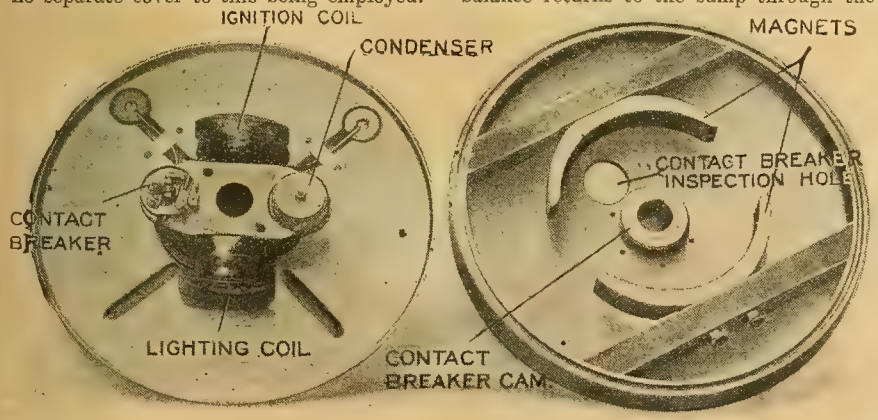
A simple type of carburetter is fitted, manufactured by the Hawker Engineering Co., Ltd., and so arranged that the air is controlled mechanically according to the throttle opening.

Quite the most attractive feature in the design of the Hawker engine is the lubrication system. A sump is bolted to the base of the crank case in which the oil is carried. When the piston descends there is naturally pressure in the crank case, and this is conveyed to the sump through the non-return valve. When the piston ascends there is suction in the crank case, but, owing to the closing of the non-return valve, which is of the simple disc variety, there still remains a certain amount of pressure in the sump, with the result that the oil is forced through the gauze filter into a hole registering with a passage drilled through one of the crank case webs and communicating directly with the drilled crankshaft. By this simple method we have forced lubrication through the crankshaft. Any excess of oil passes through the main bearing, lubricates the chains through drilled chain sprockets, and the balance returns to the sump through the non-return valve. The consumption of oil is 1,200 miles to the gallon, or 250 miles to the sump-full.

The cylinder head is detachable, and, when removed, it can be easily freed of carbon deposit, and sufficient of the piston is exposed to allow the top side of it to be cleaned without difficulty. Moreover, the use of a detachable head facilitates the cooling of the cylinder and prevents distortion.



A detachable head is one of the features of the engine. The oil sump here has been removed.



Details of the Hawker magneto flywheel.

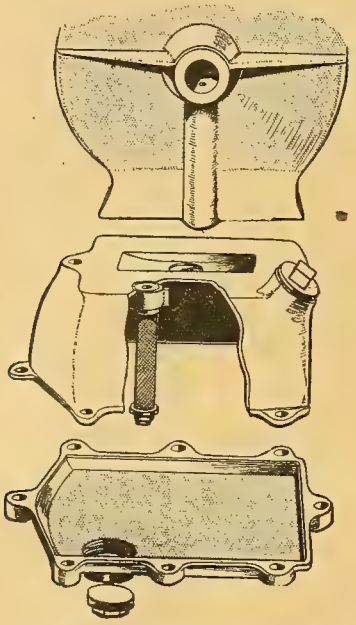
Flywheel Generator.

The ignition is by flywheel magneto, which is the subject of a patent. The flywheel is a steel stamping with a deep groove round its periphery engaging with a lip on a stationary aluminium disc, thus preventing foreign matter from entering. There are two armature coils, one above the flywheel centre, which serves to supply the current for the ignition, while the other, situated below the flywheel centre, supplies the current for the lamps. On the right of the centre is the condenser, and on the left thereof the contact breaker, which is actuated by

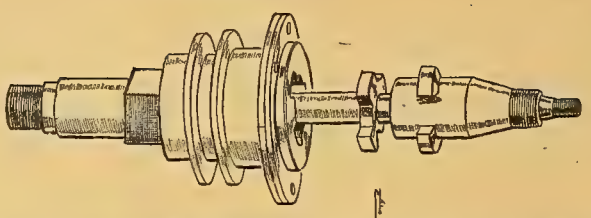
A Novel Lightweight.—

a cam on the exterior of the flywheel boss and is accessible through a covered port in the flywheel itself.

The engine is bolted into the frame in the usual manner, but the size of the engine plates is worthy of mention, as these serve not only to carry the engine but the gear box as well, the latter being supported by bolts running through longitudinal slots which allow the chains to be adjusted without interfering with their alignment. The gear box is of extremely simple design, as there are no internal wheels, but merely two chains, one for the high and one for the low speeds, the change of ratio being effected by means of a dog clutch in the gear box. A change speed lever is placed in such a position adjacent to the saddle tube that no undue force can be exerted when engaging the gears, as all that is necessary is quite a light pressure. Needless to say, both chains are enclosed.



Showing the lubrication system of the Hawker two-stroke engine. At the bottom is shown the base plate with drain plug in the centre. In the centre the main body of the sump is depicted with filter, filler cap on the right side, and the non-return valve in the centre of the trough into which the big end dips. The delivery to the crankshaft is indicated in the top illustration.



A simple gear arrangement. The dogs are inside the gear box, and there are no internal gear wheels, but two chains are employed to give the two ratios.

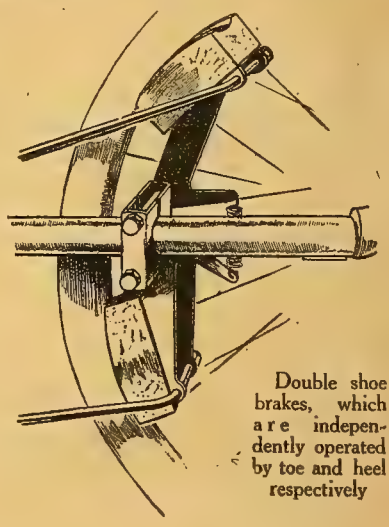
Double Shoe Brakes.

Two brakes are provided, and both are applied to the belt rim. They are constructed of stampings, and have a common take-off spring. Of these, one is worked by the toe and the other by the heel on the near side of the machine, so that in case of emergency both may be applied at once. Triumph type of forks are employed, while the saddle follows modern practice, being anchored at the peak to the top tube. Another interesting feature is the cylindrical tool case, situated at the rear portion of the carrier. It is fitted with a bayonet joint cover and is secured by a spring catch.

As mentioned before, the lighting of the machine is from the flywheel magneto, which gives excellent sparking at low speeds and a perfectly steady light at all reasonable speeds. It is intended to employ a dry battery for use when the machine is at a standstill.

Although it embodies several unorthodox features, the Hawker, in general appearance, is far from freakish; indeed, 26in. wheels and simple but symmetrical frame lines leave a machine that compares most favourably with the majority of lightweights in this direction.

The new Hawker is certainly the production of active motor cyclists: Mr. T. O. M. Sopwith has been a motor cyclist for the last seventeen years, and, though he has owned many cars, and, as all the world knows, was one of the pioneers in aviation, he has never forgotten his old love; the same remarks apply to Mr. Hawker. If it can be produced for the sum named, and we are assured that it can, the Hawker should be excellent value for money.

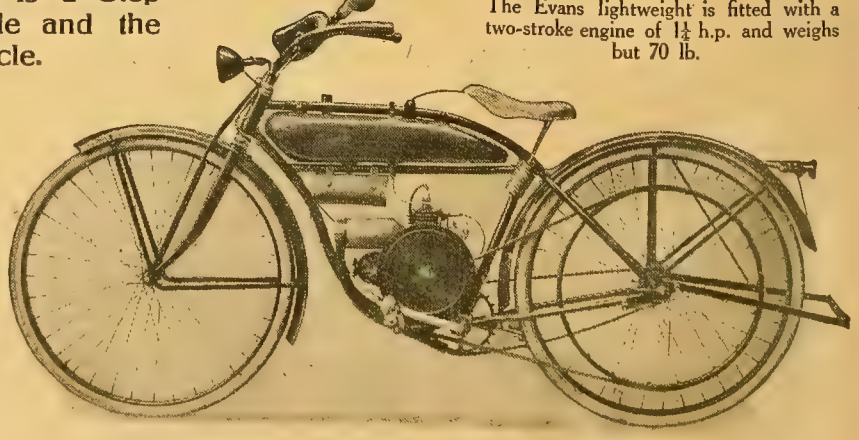


Double shoe brakes, which are independently operated by toe and heel respectively

An American 1¼ h.p. Lightweight.

The Evans Two-stroke, which is a Step between the Motorised Bicycle and the Conventional Motor Cycle.

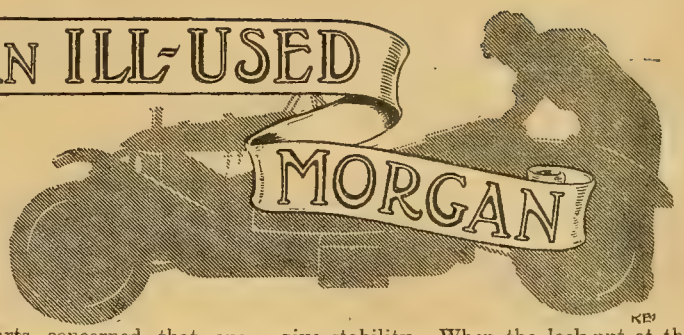
ONE of the lightest lightweights of recent years is the Evans, a sample of which we recently inspected at the showrooms of Messrs. Vivian, Hardie, and Lane, Ltd., 24, Woodstock Street, London, W.1. It is a complete motor cycle in miniature. The tiny engine of 1¼ h.p., which is of the two-stroke variety, is mounted low down in the frame. Behind the flywheel, which is a plain steel disc, is arranged the three-point chain drive driving the magneto and countershaft, whence the power is conveyed to the rear wheel through a ½in. V belt. The control is by one lever on the handle-bars, which releases the compression and also advances or retards the spark, and is the sole means of controlling the engine, no throttle being fitted.



The Evans lightweight is fitted with a two-stroke engine of 1¼ h.p. and weighs but 70 lb.

The machine is provided with a stand which flies up into position on being released, and the forks are of the rigid variety. It is interesting to note that the Berling magneto serves to illuminate the lamps. The machine weighs 70 lb.

OVERHAULING AN ILL-USED MORGAN



How an Amateur Mechanic rectified the Ravages of Time and Bad Treatment.

WHETHER or not there are many motorists to-day who would care entirely to overhaul a cycle car is a difficult matter to decide in view of present conditions; but one can be quite safe in saying that the experience gained in doing a job of this character is invaluable.

The machine in question was bought at almost a moment's notice, and without the possibility of making a previous examination, hence the decision to take the machine down entirely and make a systematic overhaul. Despite the work entailed, the ultimate cost of the overhaul was 50% lower than if the work had been carried out by a garage, as the cost of skilled labour was avoided, and, taking into account the bargain price of the machine in the first instance, a big advantage all round was gained.

Overhauling the Chassis.

At the outset the body, radiator, and engine were removed and put aside for the time being. The chassis was then mounted on a platform and stripped completely, the only parts not dismantled being the wire spokes of the wheels. With an old iron bath and a gallon of paraffin each part of the chassis was scraped, washed, and cleaned thoroughly, and then inspected for signs of wear and tear, and notes made for reference purposes.

The first repair job concerned the sliding mountings which carry the stub axles at the front of the chassis. The axle mountings had worn so badly that the front wheels leaned inwards instead of slightly outwards, and there was so much slack in the parts concerned that one could rock the forepart of the chassis sideways two or three inches, there being no measure of lateral stability whatever.

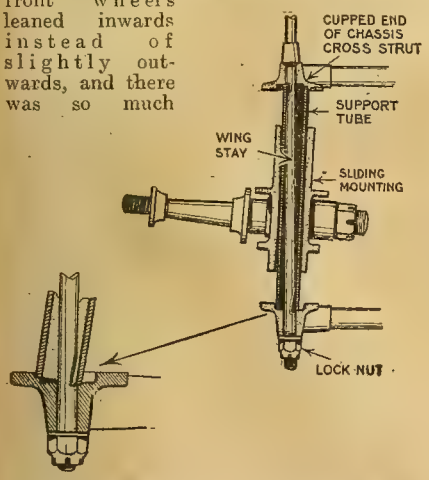


Fig. 1.—Through sheer neglect the supporting tube, carrying the front axle mounting, had worn in the chassis lugs and tilted over sideways. In the smaller sketch is shown how the supporting tube cuts its way into the wing stay.

The cause of the trouble is shown in fig. 1, where it will be seen that the stub axle is tilting upwards instead of slightly downwards. Investigation showed that the lock-nut at the bottom of the vertical wing stay had slackened off, thereby allowing the cupped ends of the chassis cross struts to spring apart slightly, and allow lateral movement of the supporting tube within the axle mountings. Still continuing the investigation, it was discovered that the tube in moving had cut into the wing stays top and bottom; and if the car had been driven many miles further, the tube, axle mounting, and wheel might conceivably have come adrift from the chassis. The subsidiary diagram in fig. 1 shows, on a larger scale, the manner in which the vertical tube had moved sideways and cut into the wing stay.

In the following account of an overhaul carried out by a private owner, it is desirable that four points are made clear.

(1) The machine was bought second-hand at a low figure.

(2) It had previously covered many thousands of miles and its wearing parts neglected.

(3) The runabout appealed to the present owner in view of the comparative cheapness of replacement parts, and simplicity of the chassis.

(4) The overhaul was undertaken privately to save expense.

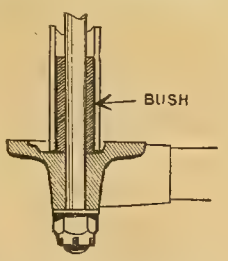

Fig. 2.—The remedy employed to realign the supporting tube of the front axle mounting with the wing stay by the aid of a bush.

New supporting tubes for the axle mounting were obtained, but it was found that they were slack in the ends of the chassis cross tubes, owing to the chafing and wear caused by the old supporting tubes; and another way out of the difficulty had to be evolved. New wing stays were purchased, and were found to fit tightly in the lugs of the chassis cross tubes. The new supporting tubes were then bushed to fit tightly on to the wing stays, as shown in fig. 2, the bushes being fully three inches long, in order to give stability. When the lock-nut at the bottom was tightened up, the two lugs at the ends of the chassis cross tubes were brought tightly down on to the supporting tube, but the latter could not move on the wing stay. This particular repair obviates the necessity of having new lugs fitted and brazed on to the end of the chassis cross tubes, and can be carried out with comparatively small expense.

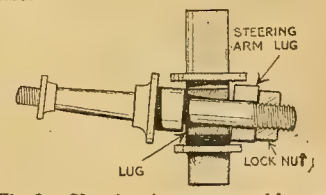

Fig. 3.—Showing, in exaggerated form, the tilting up of the axle in the lug of the axle mounting.

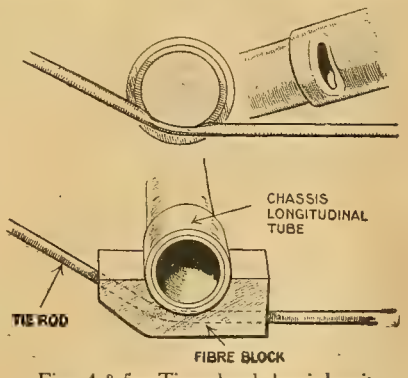
It was found that the stub axles still tilted upwards to a certain extent after this repair had been carried out on account of the lock nuts on the axles having shifted and the axles becoming loose, wearing the hole in the axle mounting to an oval (as in fig. 3). No amount of tightening of the lock nut would keep the stub axle firm, owing to the leverage exerted by the weight of the car on the stub axle. The only remedy was to rebush the lug in the mounting to take the axle firmly and without shake. Incidentally, it may be mentioned that the slackness and the rocking of the axle in the axle mounting had caused the end faces of the steering arm and the lug to wear badly; hence all these parts had to be scraped to fit again when the lug had been rebushed to take the axle.



Figs. 4 & 5.—Tie-rod and chassis longitudinal member before and after repair. In the upper sketch is shown how the tie-rod has worn through the tube, and in the lower illustration is depicted how a fibre block is interposed between the tube and the tie-rod.

Overhauling an Ill-used Morgan.—

The next item on the repair list was the inside cup of the ball bearing on one of the front wheels. The cup had become loose in the hub owing to maladjustment of the bearings generally. A new bearing cup did not fit tightly in the hub, and the only way to obtain a good fit was to take the whole wheel and mount it on the face plate of a big lathe and get the hub re-machined inside to take the cup in a new position. This repair was effected in a very short time by local machinists, but owing to the cup being fitted further into the hub (to the extent of ⅛in.), the outer dust cap of the hub fouled the axle, hence that part, in turn, had to be machined to clear the tip of the axle. This repair, incidentally, shows that alterations carried out on one's own initiative require careful planning.

A Useful Tip.

After the front wheels, axles, and mountings had been disposed of, the chassis was turned upside down, and the points of contact of the front tie-rod on the two longitudinal tubes of the frame examined carefully. It was found that vibration had caused the tie-rod not only to wear itself almost through at the point of contact, but an oblong hole had been worn in the longitudinal tubes also, as shown in fig. 4. Under the circumstances, the best repair was effected by obtaining a fibre block distance piece, 1½in. broad, and having it machined to fit snugly against the tube with a fairly large bearing surface. The outer face of

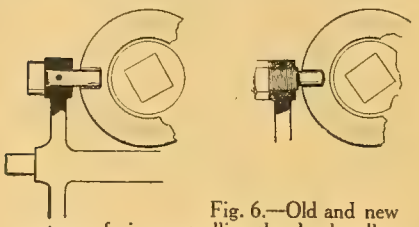


Fig. 6.—Old and new systems of pins controlling the clutch collar.

the block was then grooved carefully to take the tie-rod, as in fig. 5. These blocks were made for both points of contact of the tie-rod on the frame.

Clutch Withdrawing Collar.

In the machine in question, the fibre collar withdrawing the clutch is controlled by two cross pins in a pivoted fork. These pins are a "push-fit" in the arms of the fork, and are locked by a split pin (as in fig. 6) in each case. Owing to wear of the pins in the arms, these parts were scrapped and two bolts substituted with lock nuts; the bolts have the threads turned off for ⅜ths of an inch at the end to fit snugly into the holes in the clutch collar. The advantage of the bolts over the plain "push-fit" pins is that they can be screwed in, or out, to obtain a nice floating fit in the clutch collar without binding, and once they are locked by the nuts they cannot move in the arms of the clutch fork.

In a test run before the car was taken down for overhaul a certain amount of front wheel wobble was manifest, and was accentuated by the direct steering system of the Morgan. All the pins were renewed where necessary, but should any reader undertake this work

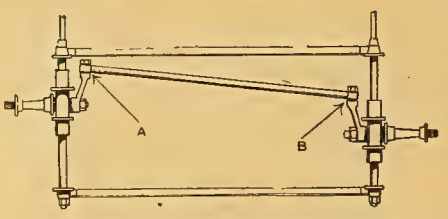

Fig. 7.—How the steering tie-rod moves out of the horizontal position when one stub axle rises higher than the other.

on a Morgan it must be remembered that a very small degree of slack must be left in the steering pin joints, owing to the difference in vertical movement that may occur between the rise and fall of the stub axle mountings when on the road. This movement will be seen more clearly on reference to the diagram, fig. 7, where it will be observed that when, for instance, the left-hand axle rises and the right-hand axle stays in its normal position the tie-rod moves out of parallel, and is, therefore, inclined to bind on the steering pins A and B.

Attending to the Gears.

Having seen that the engine bearer plates are true and not distorted in any way, attention was then directed to the rear of the chassis, and, in particular, to the gear box, rear forks, back axle, and chain transmission. The ball bearing on the propeller-shaft behind the bevel pinion was found to be very badly worn, and allowed the pinion to withdraw out of engagement with the crown wheel. The gears, in these circumstances, were comparatively quiet, but the bearing had in any case to be renewed, which resulted in the bevels going back to their original or correct position of engagement, and, since the teeth of the wheels engaged with each other in a new area of contact, they became very noisy on trial when the machine was again on the road. This noisiness, however, disappeared after a time when the bevels had become worn in their new position. All the chains and sprockets were worn, but as the low gear is seldom used on a fast and powerful little vehicle of this type, only the high gear chain and sprockets were renewed.

Inspection of the forks showed that the machine, at some time or other, must

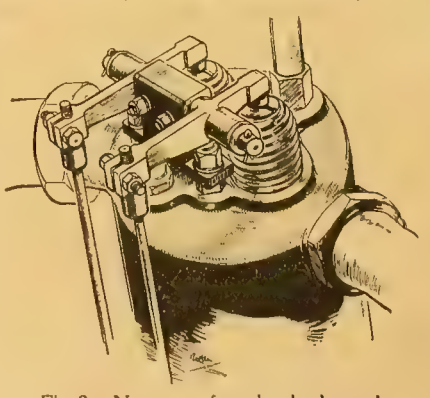

Fig. 8.—New type of overhead valve rocker gear fitted to the 90 mm. bore J.A.P. engine. Each pair of rockers is mounted on a cross pin in a single fulcrum post.

have had a violent skid, which ended in the back wheel striking an obstruction a very heavy blow, the force of which twisted the forks and bent the back axle. The forks were taken out, heated up, and restraightened, and a new back axle substituted, care being taken to see that the two ball bearings in the rear wheel hub fitted properly.

Lateral Stability of Rear Wheel.

It may be a hint to the lesser experienced Morgan owner to know that the lateral stability of the rear wheel almost entirely depends upon the good fit of the hinge pin in the forks in the gear box. If this pin is loose in the forks, or is likewise loose in the gear box, then twisting, or rocking, of the rear wheel will result, with diminished stability on the road. In the writer's machine very great care was taken to see that the hinge pin was locked hard in the bosses in the gear box. The damage to the rear forks mentioned above also had the effect of twisting, or distorting, the leaf springs above the forks. The opportunity was taken at the time of the overhaul to see that the springs were replaced in alignment and engaging correctly with the shackles pivoted to the forks near the rear axle.

The Engine.

In overhauling, the engine was taken as a separate unit, and all the work done on the bench. The cylinders were rebored, and new pistons and rings fitted by the

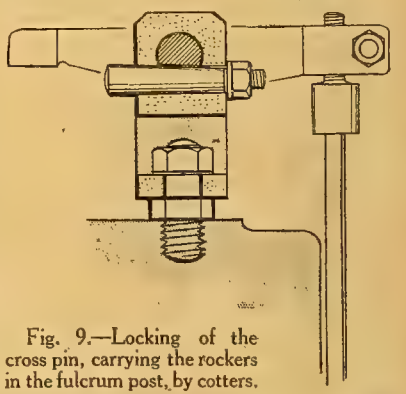

Fig. 9.—Locking of the cross pin, carrying the rockers in the fulcrum post, by cotters.

makers, and the valves and guides were also renewed. At the time, replacements for the standard J.A.P. overhead valve rockers, fulcrum posts, etc., were impossible to obtain, so a complete new set of rockers, fulcrum posts, and tappet rods was designed on a new basis and made to order. A single steel post, held to the cylinder head by two studs, supports a pair of inlet and exhaust rockers by a single cross pin, which is held in the fulcrum post by two cotters and nuts. At the tappet rod end of each rocker is a cupped bolt, which engages with the ball head of the tappet rod, and this bolt is secured in position by the split end of the rocker and a locking bolt and nut, as shown in fig. 8. All the parts are made of steel and case-hardened, and on the end of each valve stem is fitted a hard steel cap to eliminate wear likely to be caused by the movement of the rocker. The adjustment of the valve clearance is effected simply by loosening the nut on the locking bolt at the outer end of the

Overhauling an Ill-used Morgan.—

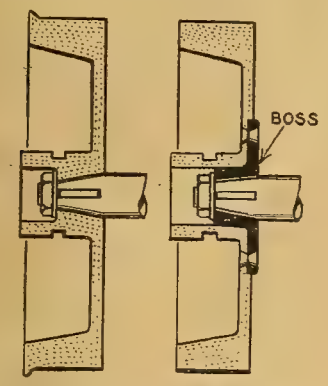

Fig 10.—(Left) The flywheel mounting in its old state. (Right) Rebossed to run true on the crankshaft.

rocker and adjusting the cupped bolt over the tappet rod, relocking the assembly afterwards.

In fig. 10 is shown the flywheel before and after repair. As the flywheel was originally out of truth on the crankshaft, it was decided to machine it in the hub to fit on a steel flange, which, in turn, was machined to fit on the tapered end of the crankshaft. As the flywheel and the new boss were machined very accurately, the flywheel ran dead true with the crankshaft, and, in order to prevent movement, the flange of the boss was riveted to the flywheel, as shown in the diagram. The necessity for truing the flywheel was due to the fact that if the wheel ran otherwise both the clutch and the propeller-shaft would run out of truth and vibrate at speed, making a smooth engagement of the clutch extremely difficult.

In assembling the engine, great care was taken to obtain a good fit in the joints in the crank case, cam box, and at the lower end of the cylinders, for the reasons that an oily engine, in the first instance, is not a pretty sight; and, secondly, oil leakage is expensive, in view of the cost of lubricating oil these days. The paper gaskets between the cylinders and crank case, and behind the cover of the cam box, were very carefully cut to shape, having no kinks or damaged spots in the paper.

Bodywork.

After the engine and chassis were assembled complete, the body was turned upside down on trestles and given a thorough wash with the water hose and brush. The object of inverting the body was to dislodge the accumulated dust and dirt in the small corners inside the body, and the cushions were removed before the operation was begun. On the body being secured in position on the chassis, it was considered advisable to reinforce the security of the tail to the main part of the body, to make it suitable to carry an extra load occasionally. Three bolts were fitted between the lateral board inside the tail and the back of the seat, as shown in fig. 11, and any tendency for the tail to droop is resisted by the bolts in that position.

In the final tuning up of the machine a good deal of trouble was taken in the adjustment of the chain transmission and brake gear. Owing to the difference in the centres between the rear axle and the fork hinge pin and the countershaft respectively, the forks move through a smaller radius than in the case of the chains, as illustrated in fig. 12. If the car is jacked up under the gear box, and the chains adjusted with the forks drooped and the rear wheel off the ground, then, on the car being jacked down to the ground again, it will be found that the chains will be too tight for running. The better plan is to adjust the chains with the rear wheel on the ground, with the forks nearly horizontal and the rear springs normally loaded.

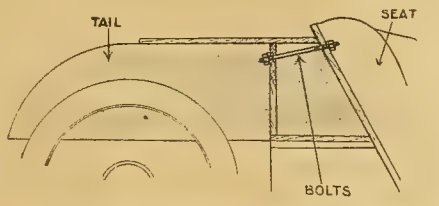

Fig. 11.—Bolts fitted to give extra security to tail on the rear part of body.

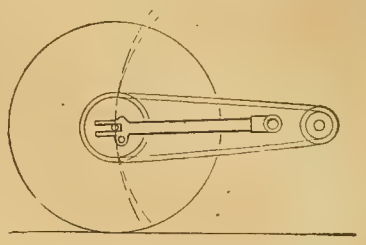

Fig. 12.—Diagram indicating the difference in radius between the fork, hinge pin, and the countershaft respectively, with the rear axle.

In regard to brakes, the efficiency of the grip of the brake bands on the drums was affected considerably by the position of the clamps on the rear fork arms carrying the fulcrum pins of the brake levers. In fitting the brakes, the position of the clamps was selected with care, in order to give the most powerful leverage of the brake arms, and, at the same time, to obtain due clearance for the brake bands on the drums in the "free" position.

In conclusion, it may be said that an overhaul of this description appeals perhaps only to a mechanically-minded and painstaking person. The saving in cash is an important point, however; and, in the case of the present machine, the total cost of the entire outfit, with new replacements, amounted to less than an everage second-hand sidecar outfit.

Adequately attired, there is real pleasure in winter riding, especially when the country is cloaked in snow.

NEXT YEAR'S SIX DAYS TRIALS.

All Motor Cycles over 350 c.c. to have Sidecars. New T.T. Regulations.

SOME interesting news came to light in the course of the Auto Cycle Union general meeting, held at Cambridge, and referred to briefly in the issue of the 23rd inst. The affiliation fees have been revised, and now stand as follows :

Div. A. 1s. 6d., Div. B. 10s. 6d., Div. C 15s., of which 6d. is to be remitted to the Centre in the case of fees paid in respect of members of a club within that Centre.

The most important announcement which we have to record is that referring to the Six Days Trials, which in 1921 will be run on entirely novel lines, so transforming the trial that it will be different from anything the A.C.U. has done before. No freak hills and no freak surfaces will be included. The following resolution was passed :

1. That a trial of at least six days' duration, to be carried out on a revised system of marking in which running cost shall be an important factor, is advisable and necessary for the further improvement of the modern motor cycle, as a demonstration of its reliability and for the encouragement of the sport and pastime.

2. That for 1921 the trial should consist of a preliminary examination and certain eliminating tests at Brooklands, the latter commencing on a Monday, and that the remainder of that day should be spent proceeding to a point "B," Tuesday from point "B" to point "C," Wednesday out and back to "C," from "C" back to "B" on Thursday, and on Friday from "B" to Brooklands, where certain final tests would be carried out, Saturday being reserved for the final examination.

3. That the tests at Brooklands should consist of :

(a) A preliminary high-speed reliability test of from about four to eight laps at minimum speeds, incorporating a test of mudguarding by running over a prepared surface each lap.

(b) A top gear slow running test down the "straight," followed by an ascent of the test hill.

(c) A silence test by audiometer and observation during *(b)* above.

(d) If found practicable, a test of springing.

(e) A brake test on the Friday, such test to be for each brake separately, and, if practicable, for both brakes together.

(f) A final high-speed reliability test of twenty-five laps at minimum speeds, followed by an examination for oil retention.

4. That by means of a special staff detailed for the work, a petrol and oil consumption test of each motor cycle for the whole distance of the trial should be made.

5. That all motor cycles of over 350 c.c. should be required to be fitted with sidecars.

6. That it would not be in the interests of the manufacturers or buying public to test the solo and passenger classes separately.

7. That having regard to the tests outlined above, and the suggested increased severity of the schedule of marking, the severity of the road portion of the trial should be reduced as compared with previous Six Days Trials.

8. That lightweights should be encouraged, particularly having regard to the revision of taxation, and that a class or classes should be instituted for motor cycles with a laden weight not exceeding 200 lb. It was suggested that the less severe road test would make it possible for lightweights of the scooter type to compete, and that entries of such should be encouraged under this heading.

There was considerable discussion concerning the advisability of granting permits for speed trials, and it was eventually agreed that before a permit was granted the organisers should guarantee that the safety of both the competitors and spectators should be ensured. It was also decided that the winners of both Junior and Senior T.T. Races, and all those entrants finishing within thirty minutes of the winner's time, should be transferred to the expert class without further qualifications, and that all other entrants finishing the course within the time limit for their respective race should be credited with a "first."

The new and recently amended international silencer regulation will be adopted in the T.T. if passed at the next F.I.C.M. meeting in Brussels. It reads as follows : "All motor cycles taking part in any competition must be fitted with an efficient exhaust system, as may be required by the rules governing such competition, but in races a free exhaust may be permitted. In all cases the exhaust gases must be so ejected as not to raise dust, or otherwise be dangerous to a competitor. Uncovered exhaust ports in the walls of the cylinder are forbidden in all competitions."

It was suggested that the following regulation should be added to the A.C.U. competition rules : "All racing motor cycles must be fitted with at least one brake operating on the rear wheel, which should be capable of bringing the machine to a standstill should any part of the transmission become inoperative." Submitted to the General Committee, this proposed regulation met with considerable opposition, Messrs. W. H. Wells and Harry Reed taking strong exception to it. The matter was therefore referred back for further consideration by the committee.

The number of open competitions already sanctioned, namely, twenty, has been increased to thirty.

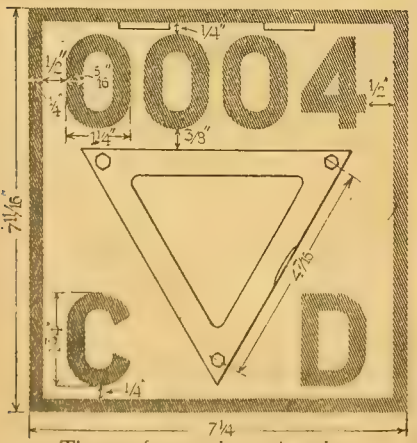
TRADE NUMBER PLATES FOR 1921.

Details of the Regulation Plates for Trade Purposes.

UNDER the new system of taxation and licensing, the existing arrangement of trade number plates is annulled, and in its place will be substituted a new scheme in which a trade licence will be embodied in the plate. The following extracts from the Memorandum issued by the Ministry of Transport are of interest to manufacturers and dealers :

"Under the new system a manufacturer or dealer may obtain from the county council (or county borough or burgh council) in whose area his business premises are situated an annual licence for the sum of £10, which will be applicable to any vehicle, or a licence at the annual rate of £1 10s., which will be restricted to any vehicle of the 'cycle' class, which class includes all vehicles with not more than three wheels, and not exceeding 8 cwt. in weight. Any such licence, however, only entitles the owner to have one vehicle upon the road at any one time for a prescribed purpose. Applicants may take out such number of these licences as they may reasonably require.

"Any such licence must be carried on the front number plate of the vehicle in use."



The new front trade number plate

A large front number plate bearing a triangular licence card holder will be compulsory, and will conform to the following specification :

Licence Holder.

"The form of holder must be of metal and of weatherproof construction. It must be triangular in shape, and conform to the measurements specified hereunder :

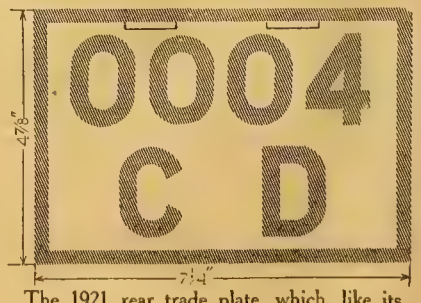
"The plate to be painted with two coats of good oil paint and a finishing coat of enamel paint of a pure white colour. The plate to be drilled with three $\frac{3}{16}$in. clearance holes, in the positions shown on the accompanying drawing, suitable for attaching the licence holder to the plate with $\frac{3}{16}$in. metal bolts. The holes to be drilled to the same template as that used for the licence holder.

"The figures and letters and a $\frac{1}{4}$in. border round the edge of the plate to be painted a signal red colour.

"To be flat and rectangular in shape, $7\frac{1}{4}$in. in length and $7\frac{1}{4}$in. in depth.

"Two rectangular slots, 1in. in length and $\frac{1}{8}$in. in depth, to be made in the plate as shown on the accompanying drawing, and to be suitable for attaching the plate to the motor cycle by means of straps or otherwise."

The rear plate must be of similar construction but without the licence holder, and should measure $7\frac{1}{4}$in. in length and $4\frac{7}{8}$in. in depth.

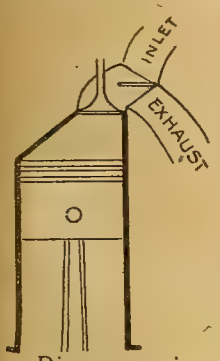


The 1921 rear trade plate, which, like its companion, is to be red on a white ground.

An Unusual Valve Gear.

A Single Compression-retaining Poppet Valve acts in Conjunction with a Distributing Flap Valve.

MODERN valve gear, particularly side-by-side valve gear, is, like the sidecar, something of an anomaly. Theoretically it is often most inefficient, but, practically, it appears to function extremely well indeed. However, there is no doubt that valve efficiency can be improved; the problem lies in making this improvement without impairing reliability.

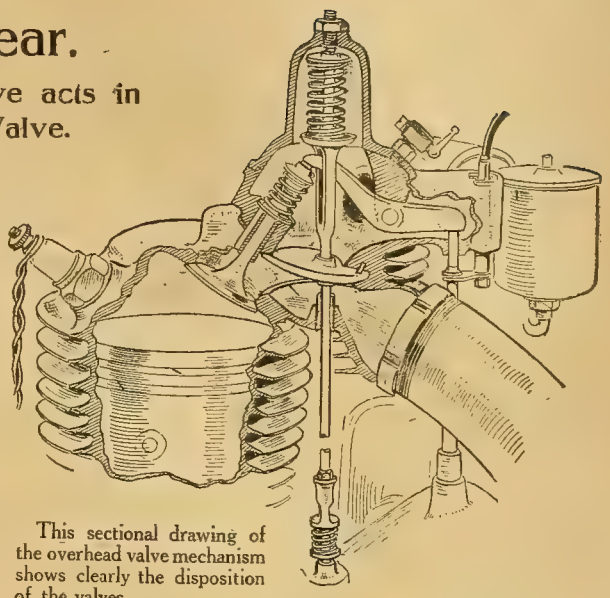


Diagrammatic arrangement showing the flap distribution valve.

The design we illustrate, adapted to a Rudge, necessitates an entirely new cylinder head, giving approximately a hemispherical combustion chamber, into which is set at an angle a large overhead poppet valve. A flap valve, pivoted at the fork of the inlet and exhaust passages, oscillates in turn on seatings on these passages, and thus acts as a distributer. A cam-actuated push or tappet rod engages in a ball socket underneath the flap valve, while above the valve is another rod similarly fixed and held down by the main spring, which, of course, does not need to be of excessive strength.

The action is simple. The main valve remains open approximately all through the exhaust and inlet strokes, while the flap valve changes over from the inlet to the exhaust seating at the correct moment for the induction stroke.

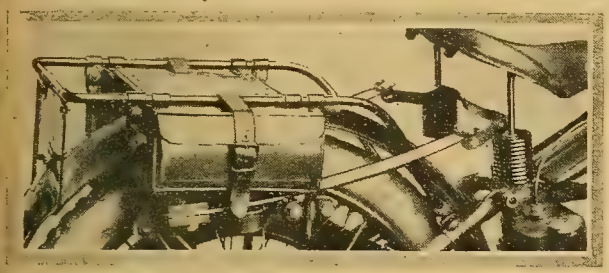
Among the advantages claimed for this design are totally enclosed operating mechanism, free gas passages, efficient combustion chamber, and a slow operating main valve which permits (1) a larger valve, (2) a greater lift, and (3) a weaker spring. Also the wasteful exhaust valve lifter is abolished, for, as may be gathered from the drawing, the action of lifting the main valve for starting does not nullify the effect of the induction stroke.



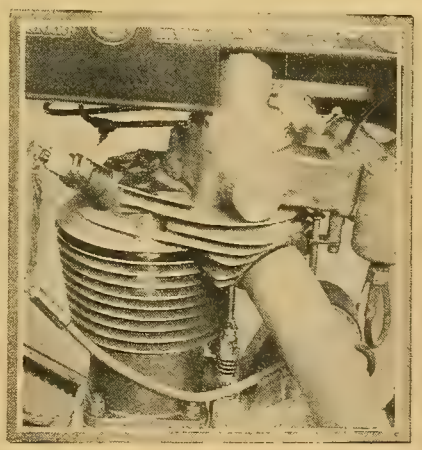
This sectional drawing of the overhead valve mechanism shows clearly the disposition of the valves.

Improving the Suspension.

The converted Rudge of the inventor (Mr. W. A. James, 115, Rosebery Road, Muswell Hill, London, N.10) has another interesting feature. This consists of a spring saddle pivoted in front and carried on two long leaf springs attached to the carrier in the rear. A short run on the machine demonstrated the efficiency of this springing system. The engine also appeared to pull remarkably well, though, without further tests, it would be impossible to give an idea of how much improvement has been effected by the valve gear. We are informed that these devices are fully patented by the rider who has carried out the conversions on his own machine.



An arrangement of leaf springing which obviates the use of a saddle-pillar. The front of the saddle is pivoted on to the frame.



External view showing the enclosed valve mechanism which is fitted on to a Rudge engine.

ALUMINIUM NUMBER PLATES.

IT is a long time since we inspected neater number plates than those supplied by Mr. Thomas-Taylor, Green Lane, Wolverhampton, for a Sunbeam motor cycle in our possession.

The rear plate is a solid aluminium casting, and the letters and figures are most clearly defined. The marks in question are riveted on to the plate, the rivets being solid with the letters and figures, and cast so that they are invisible in the finished article.

The front plate is provisionally patented, the difficulty at first being to get the steel plate at the bottom suitable for fixing on the lugs of any make of machine. The patented method of fixing overcomes this difficulty.

There is no seam or joint along the top, and the result is a really excellent job, calculated to enhance the appearance of the smartest motor cycle on the road. Motor cycle sets cost 21s. postage paid, and a point is made of the fact that the finished plates can be despatched the same day as the order is received.

A set of number plates remarkable for their fine finish.

A NEW PLUG.

A NEW plug, which, it is claimed, will never soot up, is the Automatic, sold by the Alterna Cycle Light Co., 89, Farringdon Street, London, E.C.4. Its chief peculiarity is the loose sparking points on the central electrode, which are free to turn or slide up and down.

The Automatic plug.

The Editor does not hold himself responsible for the opinions of his correspondents.
All letters must be addressed to the Editor, "The Motor Cycle," Hertford Street, Coventry, and must be accompanied by the writer's name and address.

ANOTHER IDEAL.

Sir,—My ideal motor cycle would be a B.S. Norton with the standard wheelbase, fitted with a light, strong gear box, clutch, two speeds, foot controlled change. I think the best ratios would be 4 to 1 and 5.75 or 6 to 1. Chain drive would be employed with a simple, securely fastened guard over each chain. Such a machine should be super-excellent for speed, handiness, riding comfort, control, and simplicity. Doubtless other readers have somewhat similar tastes.

Stamford. P.F.C.

TENNIS FOR A.C.U. STAFF COMMITTEE.

Sir,—I thought that a good many of your readers might be interested to know that the Staff Committee of the Auto Cycle Union has decided to inaugurate a tennis club, to commence with the 1921 season. This project has been enthusiastically received, and the chief problem at the moment is to secure the use of a suitable ground in the suburbs of London. Should any readers of *The Motor Cycle* know of such facilities they would greatly oblige by communicating with the writer.

P. A. EYLES,
Staff Sports Hon. Sec., Auto Cycle Union.

London, S.W.1.

"IXION" BLUSHES!

Sir,—I have just finished reading "Motor Cycle Reminiscences," by "Ixion," and can thoroughly recommend the book to all readers, whether motor cyclists or not. It is an excellent history of motor cycles from the day of their birth to the present time.

There is no dry technical reading: just a story, excellently written, of how the motor cycle emerged from its dark prehistoric days into modern times of efficiency and fame.

The author, apart from giving an interesting sketch of the trials of various types of engines and machines in the early days, keeps the reader amused by recounting his own experiences on these "early monstrosities and contraptions." To read some of these experiences (and there are many) is as good as a tonic.

The book is written by one who has had practical experience of motor cycling since its birth, and who has been closely associated with the movement throughout.

"Ixion" needs no introduction to the motor cycling world. I congratulate "Ixion" (whatever his real name may be) on this masterpiece, and hope that all motor cyclists will read this interesting and humorous volume.

Edinburgh. LEA-FRANCIS.

A JOINT CRITICISM.

Sir,—As two keen motor cyclists, we have perused your "Show" copies with much interest, especially the criticisms of Olympia.

There is one small point at Olympia, however, which particularly impressed us—the effort necessary to declutch on the various machines with hand-operated clutches—a detail, we admit, but a point of importance on long runs. Among the easiest were the B.S.A., the 4 h.p. Blackburne (Burman), and the 3 h.p. Royal Ruby—in fact, the last-named was so light that we wondered if the full number of springs was in use.

There was also a large number of machines of the *de luxe* type, which, although fitted with detachable wheels, had to have a speedometer pinion on each wheel. Surely if the A.J.S. people can do without these superfluous pinions other makers can do so. Also what a tremendous number of machines had not got the speedometer drive complete, the driving pinion being missing. If a manufacturer cannot attend to a small point like this for a Show machine, he certainly cannot be trusted to attend to the small details in the ordinary way.

We wonder if the tyre manufacturers will ever realise the need for a decent motor car valve instead of a push bicycle one, which breaks so easily? CD 5510.

Worthing and Hove. BY 7148.

THE CASE AGAINST THE HAND PUMP.

Sir,—I was interested to read the remarks on motor cycle lubrication in your paper by "Criticus." My experience bears out his statement that the average motor cycle engine is over oiled half its time, and under oiled the other half. I am riding a 4 h.p. single cylinder engine, made by a well known firm. It is fitted with the old-fashioned hand pump, and though I have much admiration for this make of motor cycle I think it is a pity that it should stick to such a method of lubrication.

My objections to it are, the alternate over and under oiling which first floods and then starves the engine, the risk of seizure because so much is left to the judgment of the rider, excessive carbonisation, the awful waste of oil, and the difficulty of starting.

I should be glad to know what there is to be said in favour of the hand pump system, because a few makers, and those not amongst the least important, are still relying upon it. They must have a reason.

V. D. WOOD.

A POST-1921 IDEAL.

Sir,—I am glad that "Sigma" (December 16th) appreciates the Scott. It is decidedly surprising, however, that he asks for air-cooling and an orthodox frame, for it is usually admitted nowadays that the great success of the Scott is due very largely indeed to its water-cooled engine and properly designed frame. As far as the frame is concerned, the Scott still remains the only machine (excepting perhaps the Cotton) which is not primarily a push cycle with engine added. I am not maintaining that orthodox frame design has not improved immensely, but the general truth of my statement will not be denied. With regard to the water-cooling, I feel strongly that for the Scott Company to revert to air-cooling would be a retrogression.

My own 1912 Scott I would not exchange for any other machine on the road, unless it were a 1921 Scott. I admit I am an enthusiast, and keep my machine in good tune.

My experiences have shown me that for consistently good averages over hilly roads, there is no solo machine to equal the water-cooled Scott. And mine, I must emphasise, is a nine year old model.

My one big point of criticism is this. I feel that the Scott would be greatly improved by a three-speed gear.

The present gear is delightful, and the foot-change ideal, but a middle gear, though difficult to design, would be a great advantage.

And another point. When the Scott Company adopt the shaft drive we shall have the perfect solo mount.

N. WILLIAMS.

THREE-INCH TYRES ON THE CLEVELAND.

Sir,—In reply to "Ixion's" query *re* experience of the 3in. tyred Cleveland, I have been riding a Cleveland for the past four or five months over some of the worst and hilliest roads in Devon, having previously ridden a lightweight shod with 2in. tyres, with the result that I cannot speak too highly in favour of the big tyre, either from a physical or a mechanical standpoint. On the Cleveland one can arrive at one's destination and partake of refreshment without having to wait for one's internal organs to subside and rearrange themselves. The big tyres also save the machine itself very considerably in the matter of nuts and parts working loose. One can afford to have the tyres pumped up much harder (and so save the tyres) than in the case of the 2in. tyre, and still have good resiliency. The machine is very steady on grease, and gives one that very desirable feeling of stability, comfort, and security.

Whilst on this point, there are several items about the Cleveland which I should think well worthy of our own manufacturers' consideration.

The direct drive magneto does away with one possible source of trouble. The multiple-plate clutch (car type) is a worthy innovation. Another very desirable feature is that the transmission, worm-driven countershaft, clutch, and change-speed gear are completely enclosed and run in oil.

The chain, although exposed and somewhat long, is very hefty for a 3 h.p. machine, and not calculated to give very much trouble, being about the size of that fitted to a 7-9 h.p. sidecar machine.

The footboards, very stout and durable, are of the hinged folding type. The compression of the engine is very high, and is not fitted with a compression release. This is rather a bad point at times relative to cooling the engine, but, nevertheless, it compels driving in the proper manner, *i.e.*, by the throttle. The deficiency of a compression release, as far as cooling when coasting is concerned, is greatly minimised by fitting a Binks carburetter, with which, by intelligent driving and use of the extra air inlet, the engine will two-stroke at all speeds, from 4 to 40 m.p.h. (This concurs with the remarks of "July" on "Misfiring of the Two-stroke" in your issue of November 11th.)

The mileage when fitted with a Binks is about 100 m.p.g. The weight is about 180 lb.

The initial outlay, owing to import duty, crate, rail, fitting of front brake and carrier, is fairly high; but, by comparison with some of our home produce at the same price, it is worth it.

I am not in any way connected with, or interested in, this or any other firm or agent, and would very much have preferred to buy British produce, if I could have obtained what I wanted at a reasonable price. G.S.

Plymouth.

WHAT IS FORCED FEED LUBRICATION?

Sir,—We notice in *The Motor Cycle* of December 16th, that you call attention to the small number of English machines fitted with mechanical lubrication. This important fact has certainly been neglected, and the writer has lately been driving a twin sidecar outfit with the usual hand-pump lubrication, and feels thoroughly disgusted with this system, since he has used mechanically lubricated engines since 1910.

The original Veloce engine was the first motor cycle engine to be mechanically lubricated. The idea was a spray of oil playing on the big end of the connecting rod. This spray of oil issued from the camshaft and was timed so that the hole in the cam always came opposite the big end when it was at its nearest point to the camshaft. This engine gave remarkably good results, but the oil pump was a source of trouble, since it ran at half engine speed and was really too busy to be reliable on a very high speed engine. In 1913 an engine of this type, but modified to get additional cooling by oil circulation similar to the new Bradshaw, was entered in the T.T. and ridden by Mr. Cyril Pullin, who finished in the Junior. The oil sump was formed with a large cooling area similar to the cooling fins on a cylinder. Owing to the speed the oil got too hot and caused a good deal of trouble by getting on to the belt. It proved almost impossible to keep the oil in the engine, for there was such an abundance of hot oil floating all over the working parts, and as the cooling effect did not give us the corresponding advantage we therefore abandoned the idea.

At present on the Velocette we are using a slow speed pump, in fact it runs at 1-75 of engine speed. It is, therefore, more reliable, and in addition the oil which is delivered by the pump never returns, consequently the engine is supplied with clean fresh oil and not oil which has deteriorated through constant circulation. VELOCE LIMITED.

P. J. GOODMAN, Director.

Sir,—As the inventor of the Best and Lloyd mechanical pump, will you allow me to comment on a statement appearing on page 754 of your December 9th issue?

This says that the "Best" pump "cannot be classed as a pressure lubricator," and it seems to me that the writer of your article can hardly be fully acquainted with the principles that govern the working of my pump; or possibly I may have misunderstood his use of the term "pressure lubricator," which I take to be synonymous with a positive or forced lubricator.

There are other types of automatic lubricator, where the atmosphere limits the available pressure, as in the so-called "suction feed" system.

Now the "Best" pump has a perfectly positive action however much the delivery of oil may be reduced. This is owing to the fact that the feed is controlled by altering the length of the stroke and not by restricting any passage.

It is clear that the pump plunger is capable of exerting practically an unlimited pressure if we take into account the source of power (the engine) and the incompressibility of oil. If there were any formidable obstruction in the delivery pipe the oil would have to find its release somewhere and would probably burst the pipe. Such an obstruction would have to be produced artificially. Experience has shown that any ordinary obstruction, such as congealed oil, is gradually forced through into the crank case.

It is sometimes argued that a mechanical pump is not positive if it depends on spring operated ball valves. I notice such a suggestion in your description of another mechanical lubricator in your issue of December 16th. This may be the case when comparatively rapid opening and closing of the valves is required, but where there is an adequate gear reduction no trouble with the working of the valves is experienced. H. WILLIAMS.

BEST AND LLOYD, LTD.

The new £4 tax on a motor cycle gives the motor cyclist the right to attach a sidecar or a trailer. Thus, while the owner of the smallest four-wheeled cycle car has to pay on the h.p. basis with a minimum of £6, the motor cyclist may have four wheels for £4. The above illustration shows a two-seater Cygnet rear car attached to an Indian motor cycle.

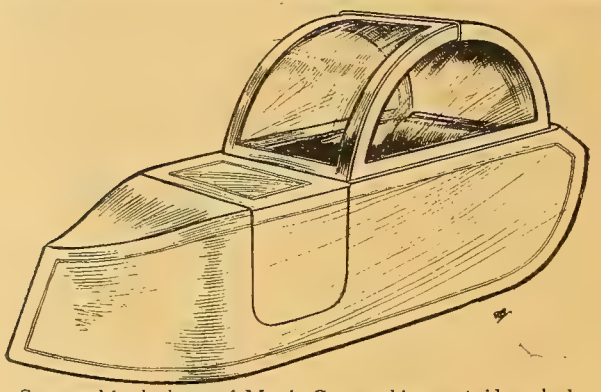
WEIGHTS.

Sir,—In view of the new taxation by weight, I suggest that motor cycle agents have a suitable weighing machine in their depots in order that purchasers may know how much their annual tax will be. LIGHTWEIGHT.

Lichfield.

A DISAPPEARING COUPE SIDECAR BODY.

Sir,—Having seen an illustration of a coupé sidecar in your issue of October 21st, I venture to send you the enclosed design in the hope that it is worthy of reproduction. The hood, when down, is completely concealed in the body of the car; the sides also lower, almost similarly to a railway carriage



Suggested in the letter of Mr. A. Groves, this coupé sidecar body possesses a disappearing top.

window. The hood, or top, is made in two sections, the front of glass or mica, and the back section of three-ply wood or aluminium, the front section sliding into the back, and the whole sliding into a compartment in the rear of the sidecar. A. GROVES.

A COMPREHENSIVE SPECIFICATION.

Sir,—My object in writing to you is to draw attention to the particular features of a design I am working on at the moment. And in view of the insistent demands in your journal, notably by "Criticus," I think it should be of special interest.

Specification: Duplex frame (spring front and rear), cushion saddle, twin two-stroke air-cooled engine of 5-7 h.p., sight feed lubrication, plate clutch, shaft drive, three-speed gear, electric lighting, all engine and gear box in one assembly with nothing but control rods and cables exposed, detachable cylinder head and crank case, brakes front and rear, wheels interchangeable and detachable, leaving brakes on frames, special mud-proof guards, adjustable mud shield for rider, and mud shield for engine. I also claim that the type of engine I have in hand, although conforming to common design, should be more efficient. It is foolproof throughout, including lubrication.

MAX YOUNG.

CHANGES IN DESIGN.

Sir,—In your issue of December 9th, "Puzzled" remarks that he was particularly struck with the fact that I have reverted to cast iron cylinders in my new engine.

After the long discussions in the past in your pages on the question of steel cylinders, which I always upheld, it is perhaps not surprising that someone should ask if I have any technical reasons for returning to cast iron ones.

The whole of design is a compromise, and the best compromise produces the best article. Steel cylinders fitted with air-cooling fins are better than cast iron ones similarly fitted because it is possible to cut fine fins on the steel barrels, and such fins can be designed to offer little restriction to the flow of air through them, whereas cast iron fins have to be shaped so as to render casting possible. Steel, also, has a heat conductivity about 20% higher than has cast iron, and (according to Dr. Gibson) a steel surface gives a greater heat dissipation than even an aluminium or a copper surface.

But years pass by and science gives us greater knowledge of which the engineer does not (or should not) fail to take advantage.

My new engine has cylinders which are not air-cooled by the methods we have previously used. They are not fitted with cooling fins at all, therefore the advantages of steel do not apply, but such advantages are replaced by other and greater advantages.

Your readers are probably not yet fully acquainted with the exact principals employed in the cooling of my new engine, nor have they seen detail illustrations of the cylinder barrels or crank case in section, therefore it is difficult (as I see from the correspondence I have had) for many of them and your correspondent "Puzzled" to understand the reason of the change. GRANVILLE BRADSHAW.

SOME REASONS WHY.

Sir,—I have ceased to be a member of any motoring association. In the first place, I can no longer afford the increased subscription, as I shall have to use the money to purchase my new licence holder and in having my number plates repainted. In the second place, I do not consider membership worth while, because it does not appear that the associations are out to help the motorist in really vital matters. Have they made any real effort to combat the provisions of the new Roads Bill, which are to cause us so much trouble and expense? Have they ever succeeded in reducing our petrol costs? I must say that the only things I have ever had for my membership have been salutes from patrols.

On two occasions I have been hung up on the road this year, but could not get any help from scouts, although two of these did appear—unfortunately belonging to a rival organisation to mine. Could anything be more absurd? Why do the associations not join forces? They might then together be a real power in the land. LIMIT.

Rugeley.

Sir,—May I be permitted, in view of the A.A. secretary's remarks, published in your issue of December 16th, to range myself on the side of "Bled Dry."

I first joined the A.A. in consequence of an advertisement appearing in your valuable paper enumerating the benefits derived from so doing, one of which is the free use of telephone boxes.

Upon remitting my second subscription, I mentioned the fact that I had not been supplied with a telephone box key. I received a reply to the effect that it would be forwarded on receipt of 2s. 6d. A remonstrance brought forth the comparison of the car owners' and cycle owners' subscriptions.

On principle, I have not remitted the 2s. 6d., more especially in view of the full page advertisement appearing in your issue for December 16th.

Is it not up to the A.A. when setting out the advantages of joining also to set out the extras which arise, and in its correspondence to mark the maxim that "comparisons are odious"? BLED DRY (2).

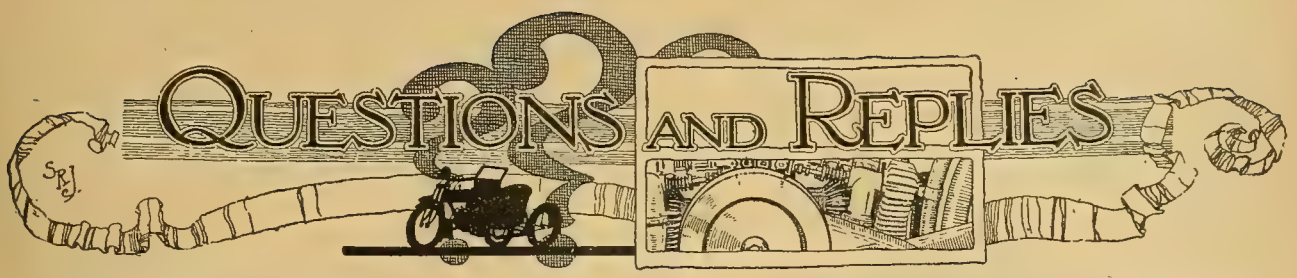
Salisbury.

BOOKS AND MAPS FOR MOTOR CYCLISTS

Issued in conjunction with *The Motor Cycle.*

	Price net.	By post.
"MOTOR CYCLES AND HOW TO MANAGE THEM." The standard handbook of the motor cycle. Covers every subject relating to all types of motor cycles, their management and care. Twenty-first Edition. Just published	2/6	2/10
"HINTS AND TIPS FOR MOTOR CYCLISTS." Containing over 400 useful "wrinkles" and helpful hints in regard to motor cycles. Seventh Edition.	2/-	2/3
"TRACING MOTOR CYCLE TROUBLES." A reliable system for tracing motor cycle faults and of remedying any trouble when found. Fourth Edition.	2/-	2/3
"MOTOR CYCLE REMINISCENCES." By "IXION," of *The Motor Cycle.* An interesting and amusing description of early motor cycling experiences, with many unique illustrations ...	5/-	5/4
"THE MOTOR CYCLE" ROAD MAPS. England and Wales, Scotland, London (showing roads into and out of London and avoiding London). Mounted on linen. Set of three, complete in case.	5/6	5/10
"THE MOTOR CYCLE" ROUTE BOOK. With 32 pages of Road Maps of England and Wales, Scotland, and the London District. New Edition. Just published	5/-	5/4

Obtainable by post (remittance with order) from ILIFFE & SONS Ltd., 20, Tudor Street, London, E.C., or of leading Booksellers and Railway Bookstalls.



A selection of questions of general interest received from readers and our replies thereto. All questions should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, London, E.C.4, and whether intended for publication or not **must be accompanied by a 2d. stamped addressed envelope for reply.** Correspondents are urged to write clearly and on one side of the paper only, numbering each query separately, and keeping a copy for ease of reference. Letters containing legal questions should be marked "Legal" in the left-hand corner of the envelope, and should be kept distinct from questions bearing on technical subjects.

Difficult Starting.

I have been all over my 4 h.p. Douglas, and everything seems to be in order, but it is nevertheless difficult to start. It will not run slowly on the stand; it either races or stops. Why is this?—C.E.B.

Probably the cause of the trouble is an air leak at the induction pipe joints. You should carefully go over the entire induction system, and, if necessary, replace the copper and asbestos flange washers, smearing them with seccotine before fitting.

Naming an Engine.

I have bought an old motor cycle and wish to get full particulars of the engine. It is a twin-cylinder, bore about $1\frac{3}{16}$in., stroke about 3in., overhead automatic inlet valves, no name whatever on the carburetter or magneto, but has a disc on the crank case marked "Brevets, Gianoli, Belge." On the pulley there is the stamping "Moto-Rêve," but I am not sure whether this was fitted to the engine in the first place or whether it is an odd part since fitted.—J.A.

The engine is evidently a Moto-Rêve. It was made in Switzerland and was fitted with the Gianoli magneto.

Uneven Running.

My $2\frac{3}{4}$ h.p. Douglas persists in firing in a very jerky manner. Both cylinders appear to fire at times, but there is nothing sweet in the running. The compression is certainly low, but considering the type of engine I do not think anything out of the ordinary. I have taken the engine down and decarbonised, taken special precautions against air leaks, ground in valves, and overhauled the magneto. The only thing is the jet. I am at present running on a 26 (Amac). Do you consider this too small?—R.P.

From your description the engine appears to be in good order mechanically, and consequently an ignition fault may be suspected. You should carefully examine the contact breaker and make quite certain that the rocker arm is working freely. Also remove the high-tension carbon brushes, and clean the slip ring on the armature by inserting a piece of rag soaked in petrol through one of the carbon brush openings. A slightly larger jet might give sweeter running. You would find that one of the variable jet adapters which can be obtained for the Amac carburetter would assist you in tuning.

An Illusive Noise.

I have a lightweight machine fitted with an Enfield two-speed gear. Recently a knocking sound has developed in the spindle of the gear. The knock is not continuous, but occurs at indefinite periods. I should be pleased to have any information you could give me as to the cause and remedy of the fault.—H.R.

Obviously we cannot tell you the cause of a sound so vaguely described as the one you mention, but as the dismantling of the gear is quite a simple operation it would be advisable to take it down. Possibly the noise is due to a broken ball race, or it may be due to the pulley being loose on the shaft.

Important Dates.

Jan. 20th—
F.I.C.M. Conference, Brussels

Jan. 28th to Feb. 5th—
Scottish Motor Exhibition Kelvin Hall Glasgow.

Feb. 12th—
A.C.U. One-day Winter Trial.

Feb 25th—
A.C.U. One-day Winter Trial for Stock Machines.
A.C.U. Silencer Trial—Brooklands.

March 25th—
Richmond Meet.

March 26th—
M.C.C. London-Land's End Trial.

May 14th—
M.C.C. London-Edinburgh Run.

Belt Slip.

I am an all-weather rider of a 1919 model $2\frac{3}{4}$ h.p. single-cylinder chain-cum-belt-driven machine, and find that some oil is thrown on to the belt from both the crankshaft and gear box. In wet weather this causes a great deal of belt-slipping. Can you suggest any contrivance or improvement that will remedy this nuisance in wet weather?—D.L.L.

In all probability the trouble is due to the bearings of both engine and gear box being somewhat worn. Make sure whether this is so or not. If worn, the remedy is obvious; but if the amount of wear is not sufficient to warrant renewals, try the effect of fitting either felt or leather washers on the shafts immediately behind the pulley and sprocket. Why oil should cause more slipping in wet weather than otherwise is not quite clear. Probably the belt needs tightening.

Fitting Magneto Switch.

Being desirous of fitting a switch on my motor cycle, and there being no terminal on the contact breaker casing for an earth-wire, would it be all right to branch a wire from the high-tension wire running to the plug?—A.S.

On no account fit a switch in the high-tension circuit. An ignition switch should be arranged only to cut out the low-tension current. If a terminal is not fitted on the contact breaker casing, it should be quite easy to make the fitting yourself. You merely require an insulated terminal which makes contact with the centre screw of the contact breaker.

Benzole and Tank Enamel.

I am using benzole in my Triumph cycle, and I find where it flows over at the filler cap it is taking all the paint off the tank. I should esteem it a favour if you could tell me what to do to prevent this.—H.C.

For 3,000 miles last year we used a Triumph sidecar outfit on N.B.A. benzole without experiencing the trouble to which you refer. We used a safety filler in replenishing the tank, and were always careful not to spill any on the enamel work, and also we did not fill right up in order to avoid flowing over when on the road.

Blow-back in Drip Feed.

I purchased a new 4 h.p. flat twin last April, and up to the present time have had a lot of trouble with the drip feed. The oil keeps blowing back from the front cylinder into the sight feed, and it frequently fills the cup and splashes all over the tank. I have written to the makers about it, and they sent me a complete new non-return valve, but the results are just as before (in fact, it is the second new valve I have fitted). A few weeks ago the whole engine was taken down for decarbonisation, but the blow back was not cured. It has quite puzzled me and many more in the town, and I should be very glad if you could advise me on the matter.—F.H.M.Y.

It is very difficult to explain the cause of the trouble if the makers themselves cannot cure it. It may possibly be due to the piston being a loose fit in the cylinder and a certain amount of gas escaping past the rings and so through to the drip feed. We assume, of course, that the crank case release valve is quite clear.

Fixed Ignition on Two-stroke.

Q. Will you please advise me regarding my 2¼ h.p. Radco two-stroke machine, which I cannot persuade to run? I have re-made the joint between the cylinder and the crank case, also the carburetter and exhaust joints. Both cylinder and piston rings are clean, and the latter are free in their grooves. Lubrication is by petroil. I have retimed the engine so that the points break when the piston is at top. Immediately after doing this I tried the machine, and it ran beautifully for about half a mile. I noticed that it soon required full air. Five minutes after this trial I attempted to restart, but without success. I tried several Lodge plugs, including two that are functioning correctly on my Douglas, but the most I could get out of the machine was an occasional bang. All the plugs gave an excellent spark when I tried them in the air, and, so far as I can see, the fault would seem to lie in some mysterious fashion with the magneto, which is of American make with fixed ignition. I also overhauled the petrol pipe and the jet, and both were clear.—G.E.H.

Presumably, you have made certain that the timing of the ignition has not slipped. It is quite common, after a machine has been overhauled, for the magneto sprocket to move sufficiently to throw the timing out. The spark should occur 6 mm. before the piston reaches the top of the stroke if the ignition is fixed. We should certainly recommend you to obtain an English magneto with variable control.

A "Waiting List" Echo.

Q. In October, 1919, I wrote to a firm *re* delivery of a motor cycle. The said firm informed me that No. 48 place on their waiting list was vacant, and that they hardly expected that particular machine through before December or January. They enclosed a leaflet giving specification of the machine and quoted the price. On the strength of these facts I wired them to book me the machine and sent them a deposit. In May I sent a complaint to the firm about the machine not having been delivered, and they enclosed a schedule of deliveries, giving date of No. 28 (to which I had been advanced) as November. They also admitted that their schedule was very disappointing and that the price had been nearly doubled, and stated that if I should prefer to cancel the order they would be pleased to refund the deposit in full. I did not reply to that letter, but purchased another machine in the meantime. On August 2nd I got a notice that my machine was in stock, and I then asked that the order be cancelled, but this they refused to do, stating they intended to keep my deposit as a "slight recompense." Will you kindly let me know if I can now *(a)* recover the deposit or *(b)* insist on their supplying the machine at the price originally quoted?—S.H.

Whether you can recover your deposit or alternatively insist on the delivery of a machine at the original price depends entirely on the wording of the contract between the dealer and yourself. Usually, the acceptance of an order by an agent is conditional upon the makers' price at time of delivery. From your letter it would appear that you rather made a convenience of the agent by allowing your order to stand until you obtained a machine from another source. You should have cancelled the order when the agent gave you the option of so doing.

Stronger Axle Wanted.

Q. I have an auxiliary engine attached to a first-class make of bicycle on which I have covered some 400 miles. The spindle of the back wheel has twice been broken and once bent. Can you suggest the reason, and advise a remedy? I have taken care to go slowly over rough roads.—M.C.H.C.

Probably the stresses imposed by the weight and extra speed of the motor attachment are too much for the spindle of the bicycle. We would suggest that you have a new spindle made of silver steel (not hardened, of course). This would probably give better results. Any good mechanic should be able to make one for you.

High Consumption on Small Engine.

Q. I have a well-known 1920 single-speed two-stroke motor cycle, and can only obtain about 45 m.p.g. on the Amac carburetter. The level is correct, and it has the correct jet, viz., No. 28. The top of the jet is only about $\frac{1}{32}$in. from the six or seven inlet holes in the carburetter. Can you help me to solve the difficulty?—N.H.B.

High petrol consumption is rather a fault of many small two-stroke engines; but it can usually be overcome by reducing the jet size, and also by lowering the level. The level should be so low that there is only about 3-64in. play on the float chamber needle. Keep the ignition well advanced, and also make sure that there is no belt slip.

An improvement to the Sterling leg shield manufactured by the Highgate Motor Co., 6, Highgate Road, Camp Hill, Birmingham. Side valances of American cloth are now supplied, either with new guards or to be fitted to those in use.

U-Nead-It Repair Outfits.

We understand that the Progressive Motor Co., 168, Regent Street, London, W.1, is handling the U-Nead-It puncture and tyre-repairing outfit described in *The Motor Cycle* of October 7th.

New F.R.S. Lamp Works.

Increase of business necessitating an enlarged staff has resulted in the removal of the makers of F.R.S. lighting equipment. The new address is: F.R.S. Lamps, "Beam Works," Vere Street, Birmingham.

Union Two-stroke Engines.

After having made upwards of 2,500 Union engines, Messrs. Josiah Parkes and Sons, Willenhall, will shortly discontinue their manufacture (by arrangement with the patentee). Meanwhile, those interested in these excellent engines should address their communications to Mr. R. S. Whaley, 50, Guildhall Buildings, Navigation Street, Birmingham.

An Engine Size Modified.

Endurance two-stroke engines, a sample of which we illustrated on page 790 in our issue of the 9th inst., now have a bore and stroke of 68×72 mm. (261 c.c.); the size quoted on the above-mentioned page referred to an earlier model. The makers, Messrs. The Endurance Cycle Co., Sheepcote Street, Birmingham, are also making complete motor cycles in increasingly large quantities.

Books and Catalogues Received.

ROVER MOTOR CYCLES.—A complete list of the various Rover models, together with prices.

DUNHILL'S SIDECARS.—A very well illustrated list of these excellently designed sidecars with full details and prices.

THE ASTRA DYNAMO.—A most attractive booklet is now issued by the Astra Dynamo Co., Ltd., 110, Victoria Street, London, S.W.1, showing how the Astra dynamo is fitted on to various makes of motor cycles, such as the 8 h.p. Sporting Zenith, the 6 h.p. A.J.S. (solo or sidecar), and the 2¾ h.p. Douglas. Parts and switches are also catalogued and priced.

THE MOTOR, MARINE, AND AIRCRAFT RED BOOK, 1920 (W. C. Bersey and A. Dorey). The Technical Publishing Co., Ltd., 1, Gough Square, Fleet Street, London, E.C.1. Price 21s. A very valuable book of reference for all motorists, containing a complete list of motor cycles, with fullest particulars. The motor cycle section is well carried out, and is accompanied by a technical dictionary in English, French, Italian, Spanish, and Russian of motor cycle terms. The book also contains particulars of motor cars, airships, industrial motor vehicles, legal information, a list of motor and motor cycle clubs, a list of technical books, and a directory.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns —First 12 words 3/–, and 3d. for every additional word. Paragraphs of under 8 words are charged double rate. Each paragraph is charged separately. Name and address must be counted. Series discounts, conditions, and special terms to regular trade advertisers will be quoted on application.

Postal Orders and Cheques sent in payment for advertisements should be made payable to ILIFFE & SONS Ltd., and crossed & Co. Treasury Notes, being untraceable if lost in transit, should not be sent as remittances.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," 20, Tudor Street, London, E.C.4, or 19, Hertford Street, Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," by the first post on Friday morning previous to the day of issue.

All letters relating to advertisements should quote the number which is printed at the end of each advertisement, and the date of the issue in which it appeared.

The proprietors are not responsible for clerical or printers' errors, although every care is taken to avoid mistakes.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, the sum of 6d. to defray the cost of registration and to cover postage on replies must be added to the advertisement charge, which must include the words Box 000, c/o "The Motor Cycle." Only the number will appear in the advertisement. All replies should be addressed No. 000, c/o "Motor Cycle," 20, Tudor Street, E.C.4. *Replies to Box Number advertisements containing remittances should be sent by registered post, but in all such cases it is advisable to make use of the Deposit System.*

In the case of motor cycles offered for sale under a box number, as it is unusual for these to be sold without first being inspected by the intending purchaser, advertisers will facilitate business by embodying in their advertisements some mention of the district in which the machine offered may be seen and tried.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown persons may deal in perfect safety by availing themselves of our Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt.

The time allowed for a decision after receipt of the goods is three days, and if a sale is effected we remit the amount to the seller, but, if not, we return the amount to the depositor, and each party to the transaction pays carriage one way. For all transactions up to £10, a deposit fee of 1/- is charged; on transactions over £10 and under £50, the fee is 2/6; over £50 and under £75, 5/-; over £75 and under £100, 7/6; and on all transactions over £100, 1 %. All deposit matters are dealt with at 20, Tudor Street, London, E.C.4, and cheques and money orders should be made payable to Iliffe & Sons Limited.

The letter "D" at the end of an advertisement is an indication that the advertiser is willing to avail himself of the Deposit System. Other advertisers may be equally desirous, but have not advised us to that effect.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard the silence as an indication that the goods advertised have already been disposed of. Advertisers often receive so many enquiries that it is quite impossible to reply to each one by post.

MOTOR CYCLES FOR SALE.

A.B.C.

NEW 1920 A.B.C. 4-speed; £150; in stock.—Randall, Andover. [0367

A.B.C. 3h.p., makers' sidecar, Lucas electric dynamo set, kick starter, done 300 miles, Smith speedometer, mechanical horn; cost £215, sell £180.—Dr. Griffith, Bures, Suffolk. [4643

3½h.p. A.B.C. Motor Cycle, dynamo lighting model, only run about 300 miles, condition as new; cash £150; may be obtained on Harrods deferred payments for a small extra charge.—Harrods, Ltd., 118, Brompton Rd., London. [4790

Are you a "handy man about the house"?

Or do you call in your next-door neighbour to help you out of many of those little "ticklish" jobs which you could do as well as he if you only knew how?

One job you can do is repairing your own boots and shoes with

DAVIS' USTIKON SOLES

You don't have to be a *craftsman* to put these soles on, but you will be surprised to see how "crafty" you will have become as soon as you have repaired a boot. No apparatus or heat is required. The method is simplicity itself.

GENTS', all sizes 3/9
LADIES', all sizes.. .. 2/9

Complete with Sol-fix and directions.

USTIKON HEELS

The wearing quality of these Heels is indicated by the fine workmanship and careful finish. In actual wear they are still better than you expect.

Select and test YOUR 1921 MACHINE at OUR RISK FOR ONE MONTH.

WE have so much confidence in our experience, judgment, and the machines we sell, that we announce a

SPECIAL JANUARY OFFER

to all motor cyclists, actual and prospective, who can select a new or second-hand machine from our stock of BEST makes, either in person or by post, and have it on test and in daily use for one month from the date of delivery. If the machine is then not entirely to the satisfaction of the purchaser it can be returned to us and exchanged for another make of not less value—No deduction will be made for the one month's deterioration, we will carry that loss. The value of the machine returned will be credited in full.

Start the NEW YEAR Well—

Start it successfully, exercise care and discrimination in your buying, be careful to ensure that you are investing your money in a machine with a good name and reputation—a machine that will sell well at any time you may wish to dispose of it. Do not sink your capital in a second-rate machine that rapidly deteriorates and has no value in the second-hand market.

You cannot be too careful, and will be well advised to allow us to help you. We offer you our experience and advice, knowing full well that, if you will avail yourself of it, you will invest your money to the best advantage. It is our business and our pleasure to assist you quite independent of sales.

We hold no brief for any particular makes of machines, but sell only the BEST, because only the best can give genuine satisfaction to our clients and ourselves. If you cannot make a personal call

WRITE TO US TO-DAY

and ask our advice—the pleasure of giving will be ours, the pleasure of receiving will be yours—and if business results, the pleasure of doing business will be mutual.

YOU TAKE NO RISK from such an offer. Do not miss it!

J. W. TOLLADY,
General Manager.

"ASLATT" TYRE STOPPING.

The £ s. d. saver of tyre bills. Permanently repairs cuts and gashes in motor, motor cycle, and cycle tyres. Saves vulcanising. Also repairs any rubber article. Once used always used.

Tubes, **1/2** (post free).

THE ASLATT TYRE STOPPING CO.
Moor Green House, West End, SOUTHAMPTON

NOTE:— BUTTED TUBES Throughout

Rigidity—

Successful Motor Cycle Service largely depends upon the construction of the frame. Rigidity is essential and the reason

REYNOLDS' BUTTED TUBES

are so largely used in the construction of modern motor cycles is because they give additional strength to the vital parts—"the joints."

And the winning of the 1920 Senior T.T. on a "REYNOLDS-Butted-Tube-built" machine is a sure proof of their efficiency

The Patent Butted Tube Co., Ltd., Hay Hall Wks. Tyseley, B'HAM.

R.H.S.

Huile de Luxe

CALL IT "WHEEL DE LOOX"

If you have a sidecar machine consider the economy of buying a 5-gallon drum of oil for your season's requirements—the saving is considerable.

We have ready an interesting, illustrated leaflet showing how you can pour oil from a drum without spilling a drop.

The current Lists give the prices of oils in drums. Please mention "The Motor Cycle."

ALFRED WISEMAN LTD., GLOVER STREET, BIRMINGHAM.

LODGE PLUGS

Standard Model (C3)
Detachable for cleaning.
Price 5/- each
EVERYWHERE
Packed in sealed red metal box.

CAUTION

LODGE Plugs are only guaranteed by the makers when they are purchased in the sealed metal boxes.

¶ The only way the makers can ensure the purchaser obtaining a Lodge Plug in the perfect condition in which it leaves the factory is by sealing the plugs up in boxes.

¶ Purchasers who buy Lodge Plugs unboxed (or even if boxed but without the lead seal) do so at their own risk, as there is no knowing in what condition the plugs are, and the makers accept no responsibility for them.

¶ Therefore, it is of the utmost importance, when buying Lodge Plugs, to see that boxes are properly sealed with a lead seal bearing the name "LODGE."
